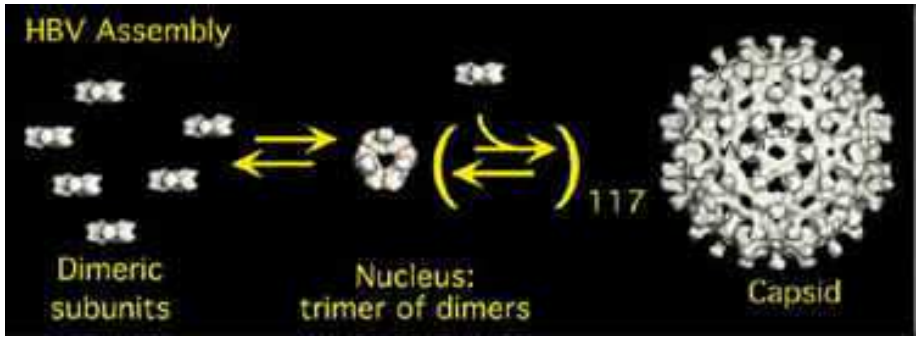
Mean-field theory of equilibrium capsid assembly

multiple chemical equilibria:

- cylinders: Lauffer, Caspar, …
- spheres: Zlotnick, …



Zlotnick '96

total free energy

$$F = \sum_{N=1}^{\infty} \rho(N)\left[\ln \rho(N) - 1 + G(N)\right] + \cancel{F_{exc}(\phi)}$$

equilibrium

$$\frac{\delta F}{\delta \rho} = \mu N \quad \Rightarrow \quad \rho(N) = \exp\left[\mu N - G(N)\right]$$

size distribution

$$\sum_{N=1}^{\infty} N\rho(N) = \phi$$

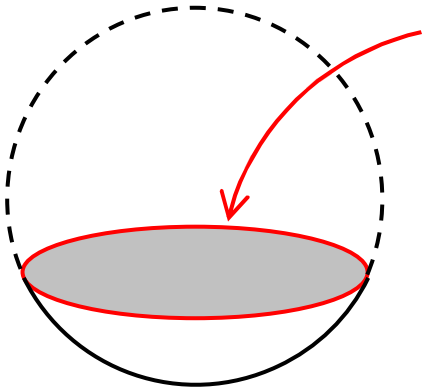
protein concentration

free energy of an assembly

$$G(N) = Ng + \Delta G(N)$$ ← "rim energy"

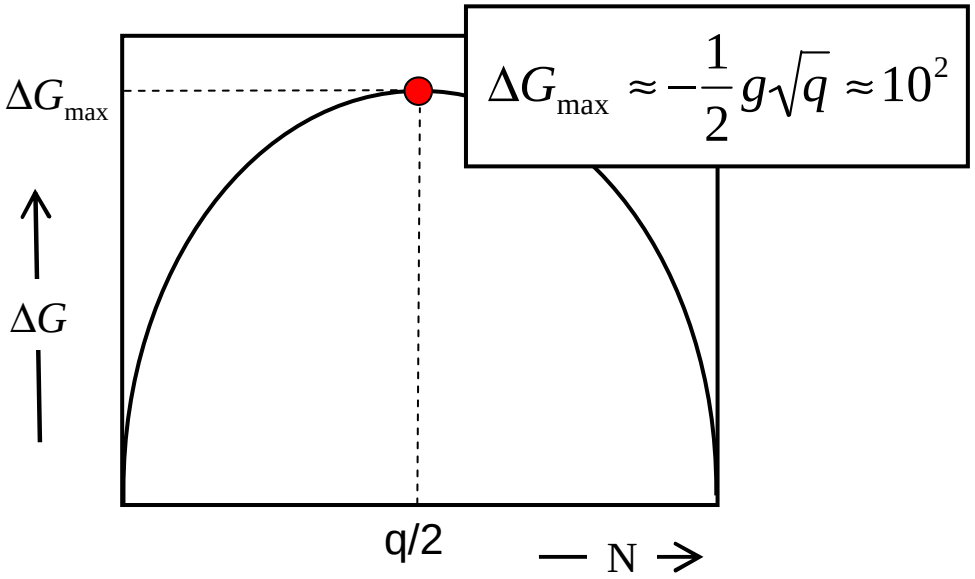
"binding strength" ≈ – *O*(10) $k_B T$

Spherical capsids: rim suppresses intermediates!



partially complete capsid
of fixed T number

rim energy $\Delta G(N) \approx -g\sqrt{\frac{N(q-N)}{q-1}} \Rightarrow G(1) \equiv 0$



- *assembly thermodynamics:*
  - $\Rightarrow$ intermediates unimportant
  - $\Rightarrow$ 2-species model sufficient
- *assembly kinetics:*
  - $\Rightarrow$ intermediates important
  - $\Rightarrow$ lag time
  - $\Rightarrow$ hysteresis

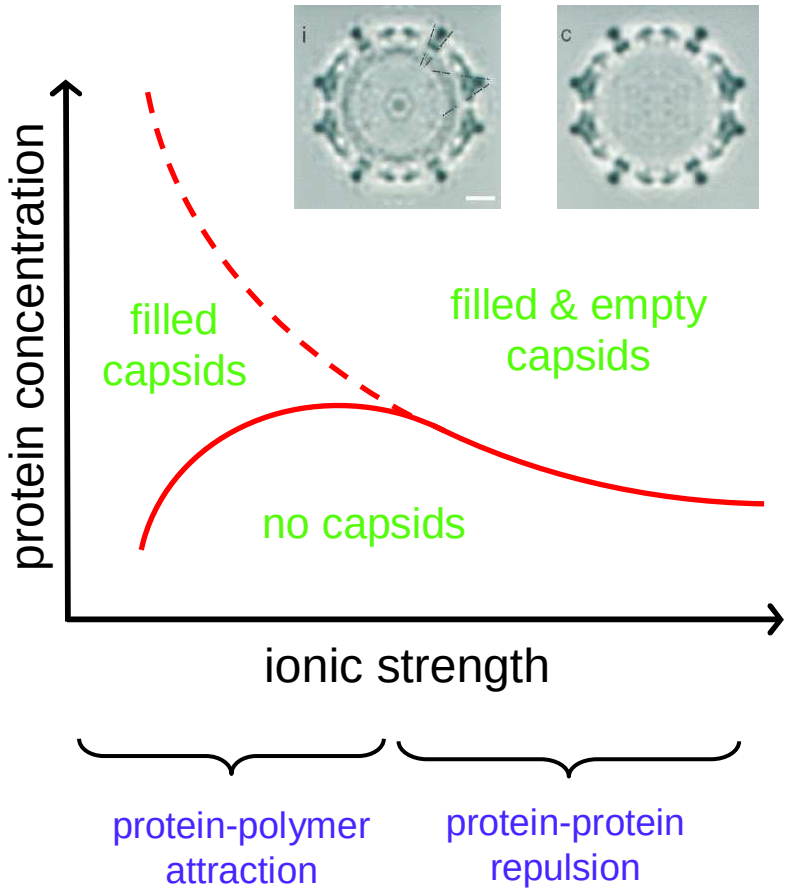
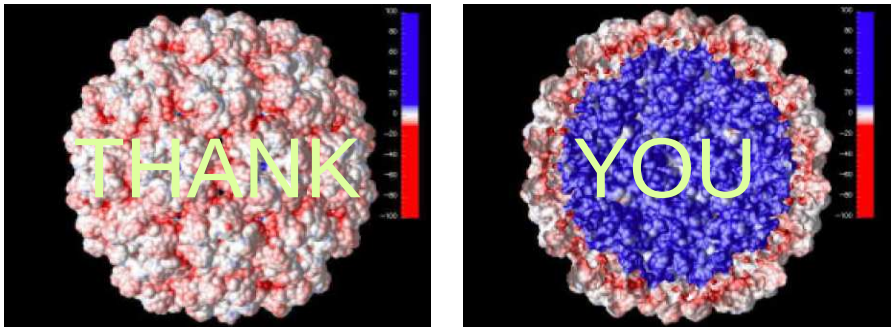
THEORETICAL ASSEMBLY DIAGRAM: FULL EQUILIBRIUM



Zlotnick et al. *PNAS* 94 (1997) 9556
Bruinsma and vdS *Phys Rev E* 71 (2005) 061928

Conclusions

- capsid assembly obeys the law of mass action
- the rim tension suppresses incomplete capsids
- the rim tension could cause nucleated assembly
- the coat proteins repel each other electrostatically
- encapsidation helps to overcome the self-repulsion



Konecny et al. *Biopolymers* 82 (2006) 106
