$k_x (\pi/a)$

$k_x (\pi/a)$

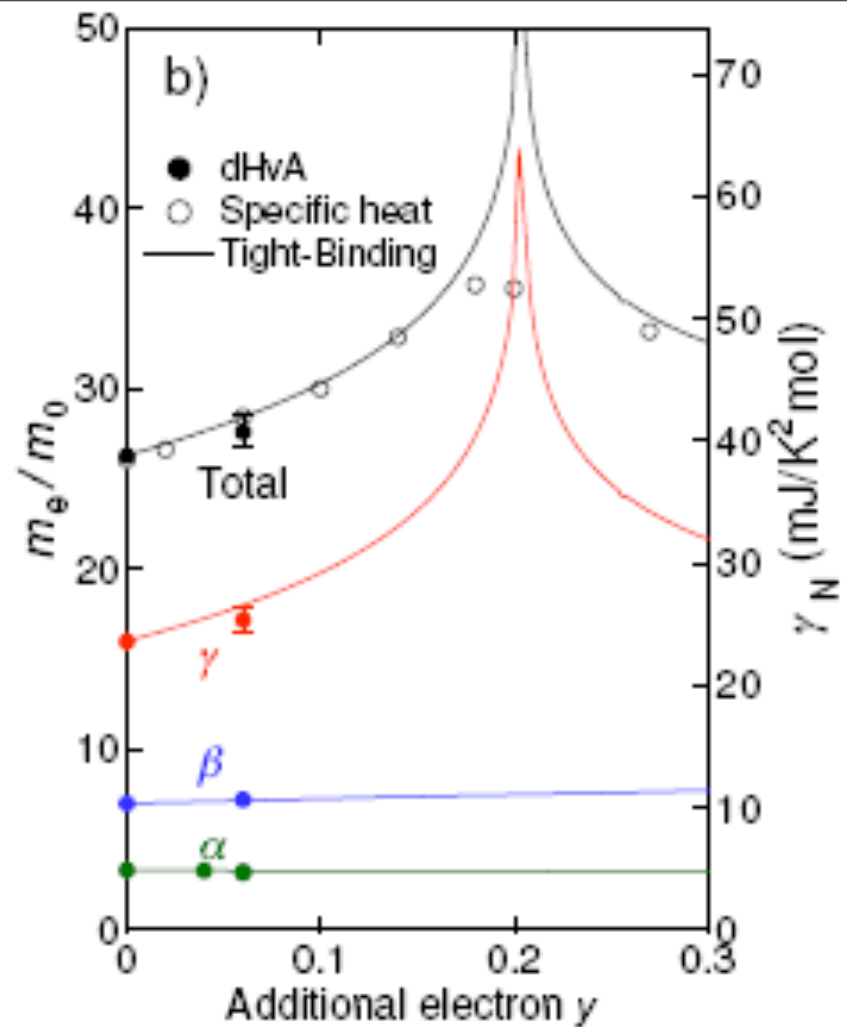

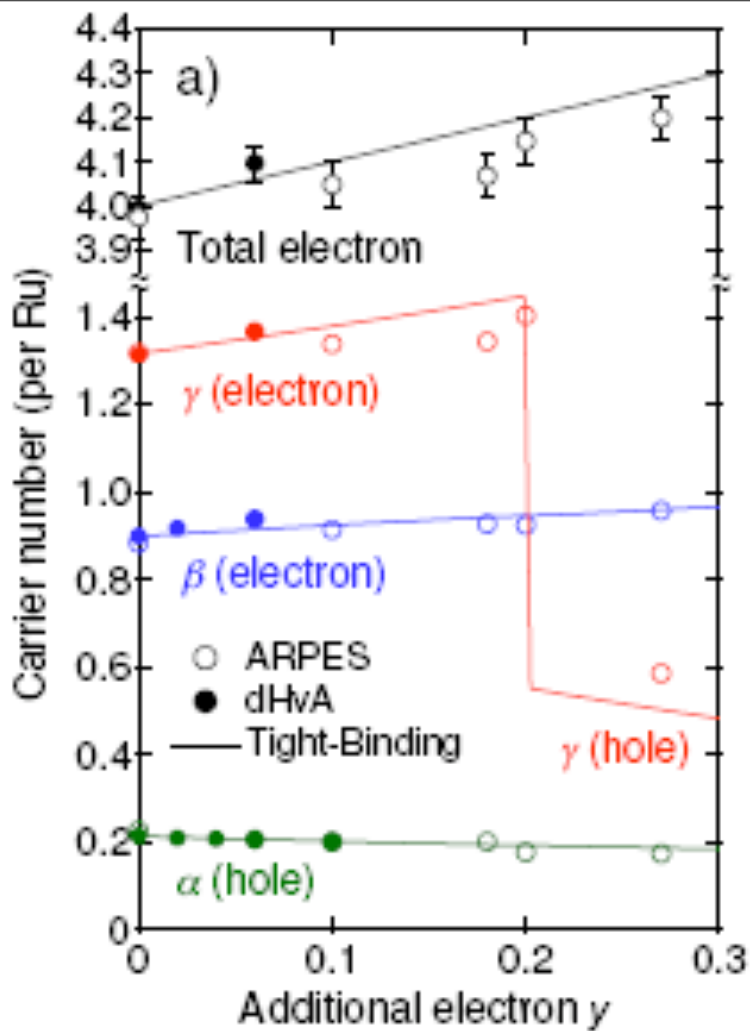

Well-defined simple cosine over much of the Brillouin zone, renormalised from LDA by dHvA factor of ~ 6 .

Well-defined simple cosine over much of the Brillouin zone, renormalised from LDA by dHvA factor of ~ 6 .

Renormalisation dominantly due to local real-space correlation: LDA + U in real life!

Beautiful rigid band shift; good fit to specific heat based on simple hypothesis that all bands are renormalised in same way.

Paper provides state-of-the-art tight binding parameterisation of real many-body quasiparticle dispersion.

2. dHvA as a probe of spin-orbit coupling

The technique

2. dHvA as a probe of spin-orbit coupling

The technique

> 10^{15} improvement in
sensitivity since 1930

2. dHvA as a probe of spin-orbit coupling

The technique

> 10^{15} improvement in sensitivity since 1930

The specific 21st century experiment

Rotate about two principal axes studying field and angle dependence of **amplitude** of dHvA oscillations.

Idea: Probe 'anomalous spin-splitting'

$$\Delta E \sim g\mu_B B$$

$$\hbar\Delta k \sim \Delta E / v_F$$

Conventional spin splitting

C. Bergemann, A.P. Mackenzie, S.R. Julian, D. Forsythe & E. Ohmichi, Adv. Phys. 52, 639 (2003)

Idea: Probe 'anomalous spin-splitting'

$$\Delta E \sim g\mu_B B$$

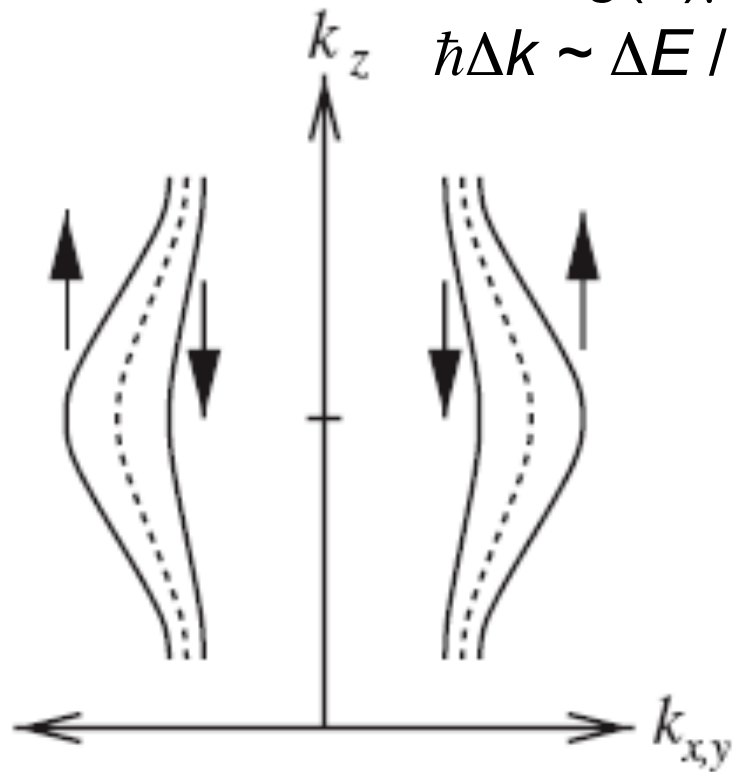

$$\hbar\Delta k \sim \Delta E / v_F$$

Conventional spin splitting

$$\Delta E \sim g(\mathbf{k})\mu_B B$$

$$\hbar\Delta k \sim \Delta E / v_F$$

Anomalous spin splitting

C. Bergemann, A.P. Mackenzie, S.R. Julian, D. Forsythe & E. Ohmichi, Adv. Phys. 52, 639 (2003)

Rotation angle about [110] (degrees)

Anomalous warping is non-trivial in shape and magnitude from one point of view

Split rate 3x larger along most rapidly dispersing directions.

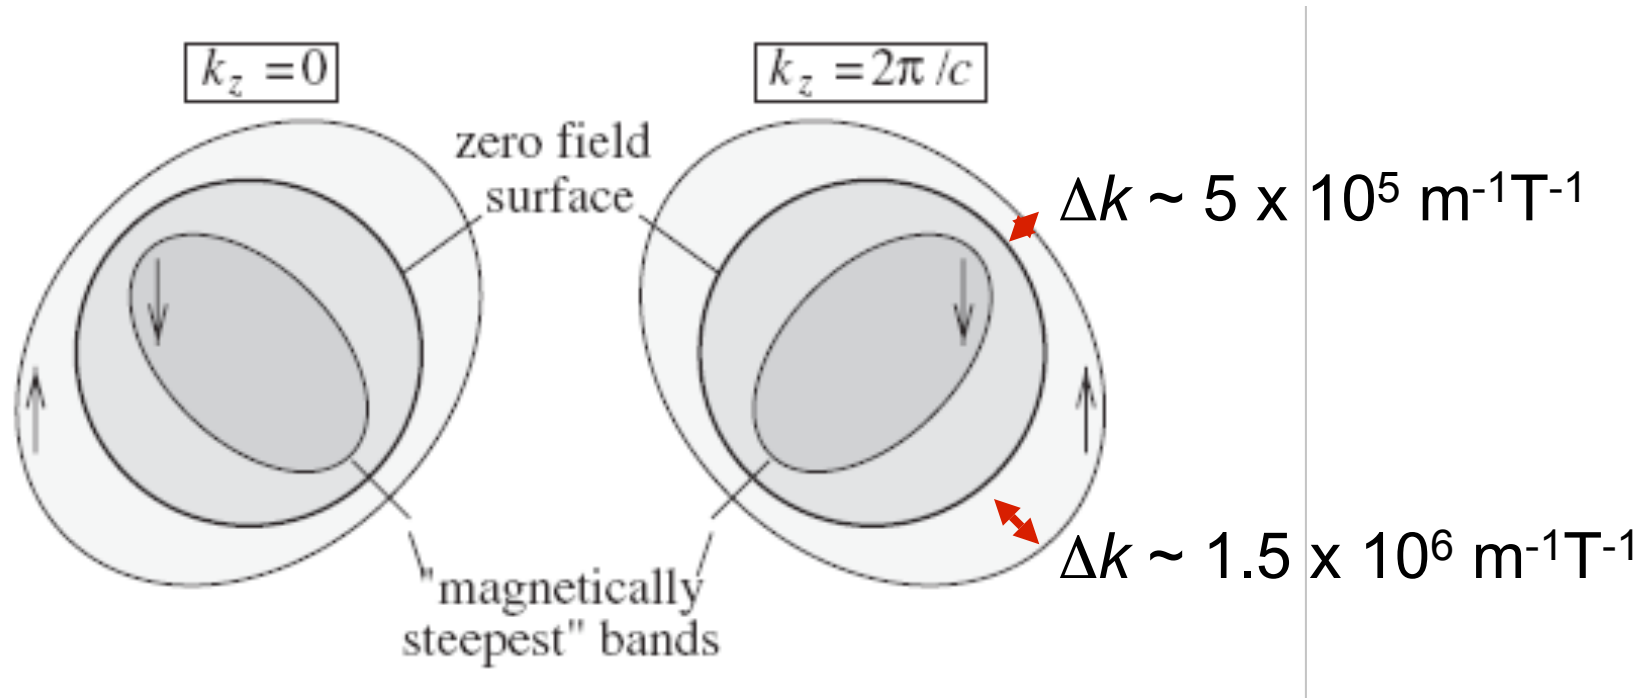

Anomalous warping is non-trivial in shape and magnitude from one point of view

Split rate 3x larger along most rapidly dispersing directions.

BUT corresponds to an energy scale of only $70 \mu\text{eV T}^{-1}$!

Anomalous warping is non-trivial in shape and magnitude from one point of view

Split rate 3x larger along most rapidly dispersing directions.

BUT corresponds to an energy scale of only $70 \mu\text{eV T}^{-1}$!

Idea for future: use top quality modern samples to study this anomalous warping accurately for all surfaces and hence map out strength of spin-orbit coupling in \mathbf{k} -space
