

# Tailoring the crystal structure towards optimal superconductors

*Emilia Morosan*

*Rice University, Houston TX*

**KITP HIGHERTC09 August 18 2009**

# OUTLINE

- *“Practical” superconductors*
  - What we know
  - Opportunities for discovery
- *Reduced anisotropy in a new Fe pnictide compound:  
 $\text{CaFe}_4\text{As}_3$*
- *Interplay between competing interactions*
  - Charge density wave and superconductivity: intercalated dichalcogenides  $1T\text{-Cu}_x\text{TiSe}_2$ ,  $2H\text{-Cu}_x\text{TaS}_2$
- *Conclusions and outlook*

# Acknowledgements

# “Practical” superconductors

- *High  $T_c$  is not enough*
  - More important: **high** carrier density, **low** electron mass anisotropy

- *What we know:*

## 1. Layered crystal structure

### Cuprates:

👍 square Cu-O lattice

👎 High anisotropy

### Pnictides:

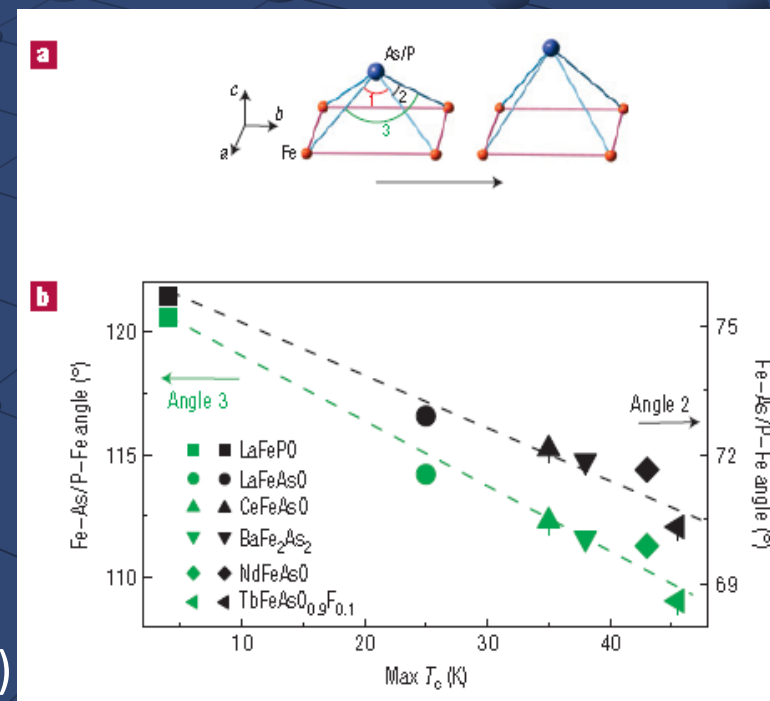

👍 “perfect” tetrahedra

👍 less two-dimensional

👎 Maximum  $T_c \sim 50$  K

much smaller than maximum in HTS ( $\sim 160$ K)

Jun Zhao *et al.* Nature Materials, 7 953 (2008)

# “Practical” superconductors

- *High  $T_c$  is not enough*
  - More important: **high** carrier density, **low** electron mass anisotropy

- *What we know:*

## 1. Layered crystal structure

### Cuprates:

👍 square Cu-O lattice

👎 High anisotropy

### Pnictides:

👍 “perfect” tetrahedra

👍 less two-dimensional

👎 Maximum  $T_c \sim 50$  K

much smaller than maximum in HTS ( $\sim 160$ K)

J. Rodgers et al., arxiv 0908.1167 (Aug 11 2009)

# “Practical” superconductors

- *What we know:*

## 2. **Competing interactions:** superconductivity and magnetism

- ☞ *Doping suppresses SDW in favor of SC*  
*Fe, Ni “1111”, “122”:  $T_c \sim 50$  K*

*Kito et al., JPSJ 77 063707 (2008)*

- ☞ *No magnetic ordering in stoichiometric LiFeAs,  $T_c \sim 18$  K*

*Tapp et al., PRB 78 060505(R) (2008)*

- ☞ *No magnetic moments in Rh, Ir, Pd, Pt “122” compounds*

- ☞ *Much smaller  $T_c \sim 1-2$  K*

*Hirai et al., JPSJ 78 023706 (2009); Berry et al., PRB 79 180502(R) (2009)*

# “Practical” superconductors

- *What we know:*

## 2. Competing interactions: superconductivity and magnetism

Saha *et al.*, PRL 103 037005 (2009)

- ☝ *Coexistence of magnetic order and SC?*

*Strain-induced SC and FM in stoichiometric  $\text{SrFe}_2\text{As}_2$*

- ☝ *Partial superconducting transitions in stoichiometric “122” compounds*

☞ *Sample-dependent*

Tanatar *et al.*, PRB 79 134528 (2009); Torikachvili *et al.*, PRL 101 057006 (2009);

Torikachvili *et al.*, PRB 80 014521 (2009)

## “Practical” superconductors

- *Opportunities for discovery*: interplay of layered structures and competing interactions
  - Superconducting “Fe-As” type layers separated by blocking layers (B)
    - $B = R-O$  (“1111”),  $A^{2+}$  (“122”),  $A^{1+}$  (“111”)
  - Beyond pnictides:  $Fe_{1+\delta}Se$ 
    - *no blocking layer*

# Opportunities for discovery

- Design potential new SC: “Fe-As” + B

## Tetragonal

Fe - Pn

B

# Opportunities for discovery

- Design potential new SC: “Fe-As” + B

*Will lower symmetry work?*

*Orthorhombic*

Fe – Pn

B

*Hexagonal*

Fe – Pn

# Opportunities for discovery

- *Routes to reduced anisotropy:*
  - pressure: push layers together
  - doping = chemical pressure
  - coupled Fe-Pn layers  $\Rightarrow$  less 2D crystal structure?

## Tetragonal

# Opportunities for discovery

- *Routes to reduced anisotropy:*
  - “locally layered” structure: **CaFe<sub>4</sub>As<sub>3</sub>**

Zhao *et al.*, PRB **80** 020404(R) (2009)

Todorov *et al.*, JACS **131** 5405 (2009)

Orthorhombic  
**Pnma**  
 $a = 11.88407 \text{ \AA}$   
 $b = 3.73422 \text{ \AA}$   
 $c = 11.58577 \text{ \AA}$

Fe-As ribbons form channels along b axis

five fold coordinated Fe

four fold coordinated Fe

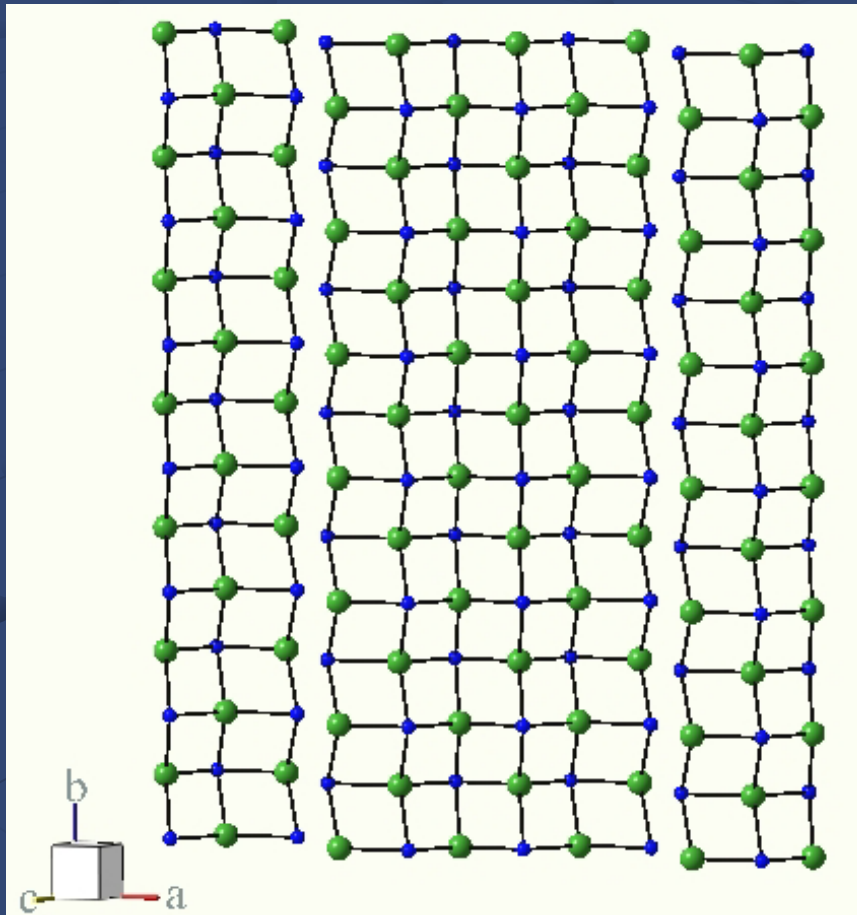

Ca ions sit in channel

# CaFe<sub>4</sub>As<sub>3</sub> – crystal structure

- *Infinitely long, narrow Fe-As ribbons*

## LaFeAsO

Infinite Fe-As planes

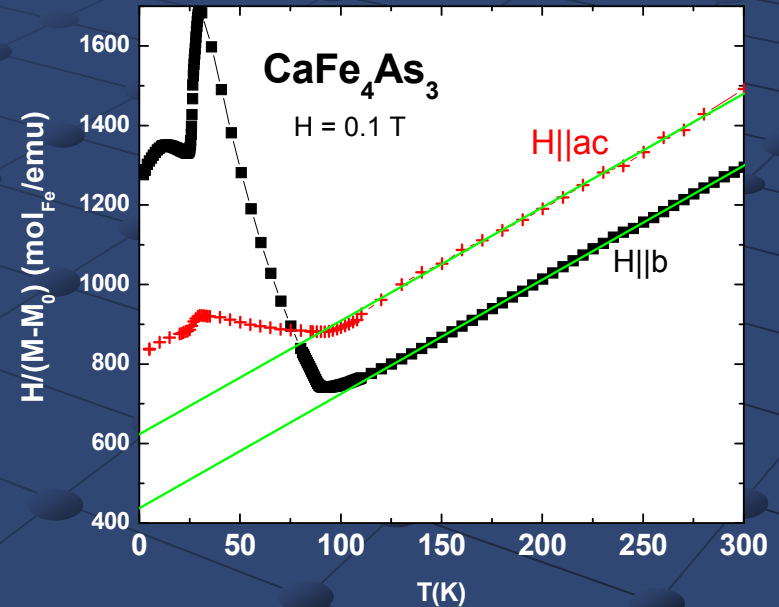

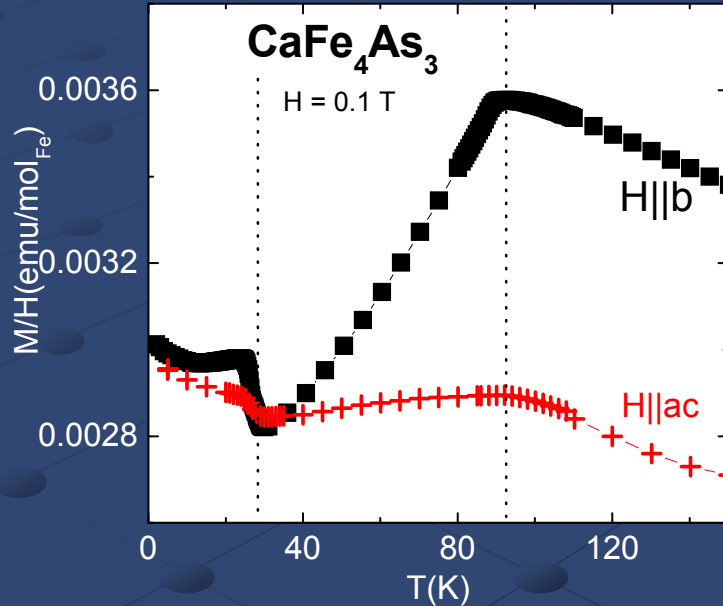

# Fermi-liquid state and enhanced electron correlations in the iron pnictide $\text{CaFe}_4\text{As}_3$

Liang L. Zhao,<sup>1</sup> Tanghong Yi,<sup>2</sup> James C. Fettinger,<sup>2</sup> Susan M. Kauzlarich,<sup>2</sup> and E. Morosan<sup>1</sup>

<sup>1</sup>Department of Physics and Astronomy, Rice University, Houston, Texas 77005, USA

<sup>2</sup>Department of Chemistry, University of California at Davis, One Shields Avenue, Davis, California 95616, USA

- $M(T) H = 0.1 T$

Curie-Weiss behavior at high T:

$$\chi(T) = \chi_0 + C/(T - \theta)$$

$$\chi_0 \sim 10^{-3} \text{ emu/mol}_{\text{Fe}}$$

$$\mu_{\text{eff}} = 1.7 \mu_{\text{B}}$$

Magnetic ordering (antiferromagnetic)  $T_N = 88 \text{ K}$

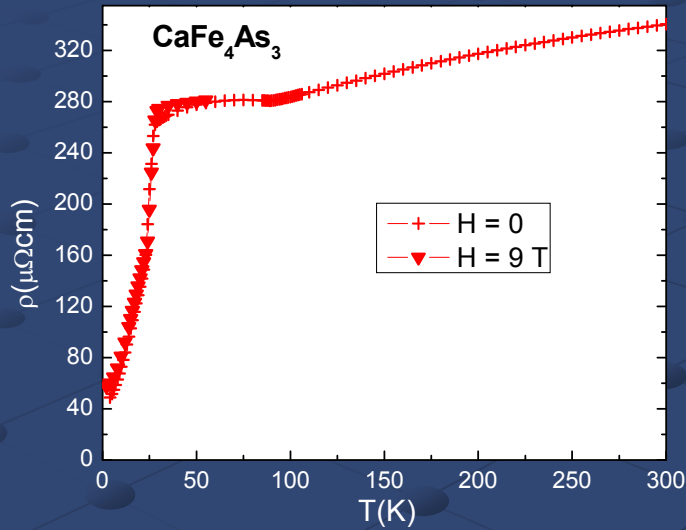

Second phase transition around  $T_2 = 26 \text{ K}$

Slight upturn in low-T  $M(T) \Rightarrow \text{FM} ?$

# CaFe<sub>4</sub>As<sub>3</sub> – resistivity

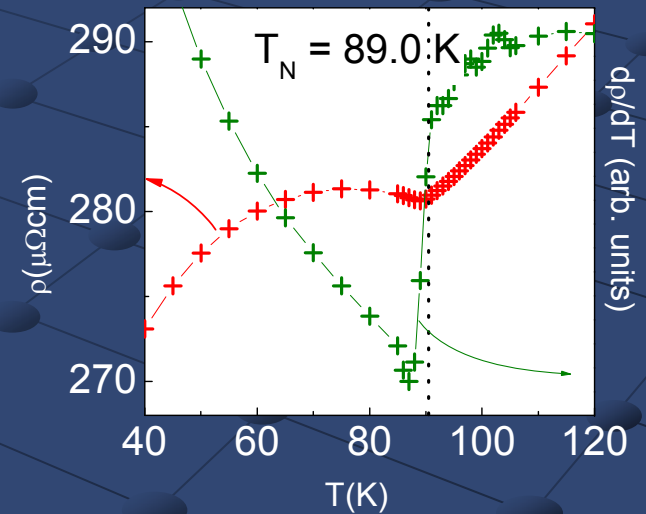

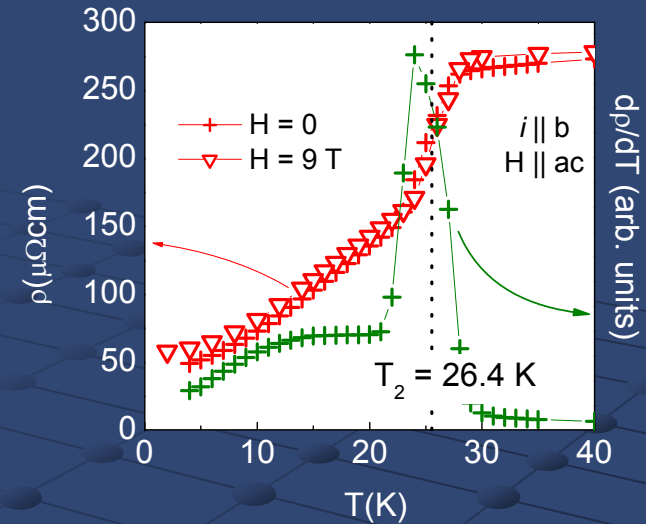

- $\rho(T)$   $i \parallel b$

Metallic above  $T_N = 89$  K

Local minimum around  $T_N \Rightarrow$  SDW

Second phase transition around  $T_2 = 26$  K

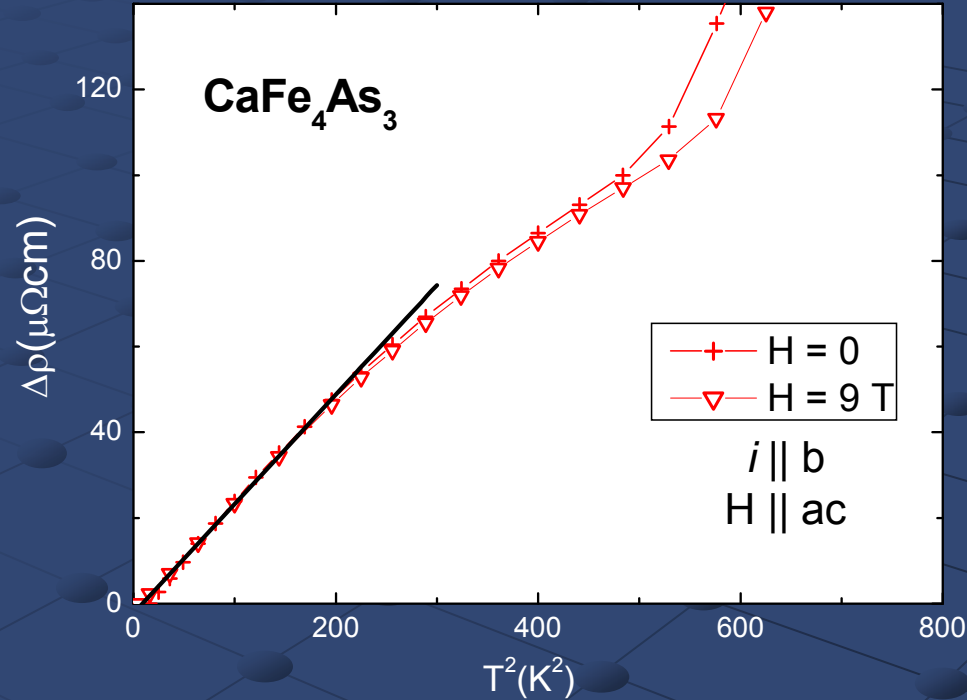

# CaFe<sub>4</sub>As<sub>3</sub> – Fermi liquid behavior at low T

- $\rho(T)$   $i || b$

$$\rho_0 = 42 \mu\Omega \text{ cm}$$

$$\Delta\rho \sim AT^2, A = 0.25 \mu\Omega \text{ cm}/\text{K}^2$$

# CaFe<sub>4</sub>As<sub>3</sub> – specific heat

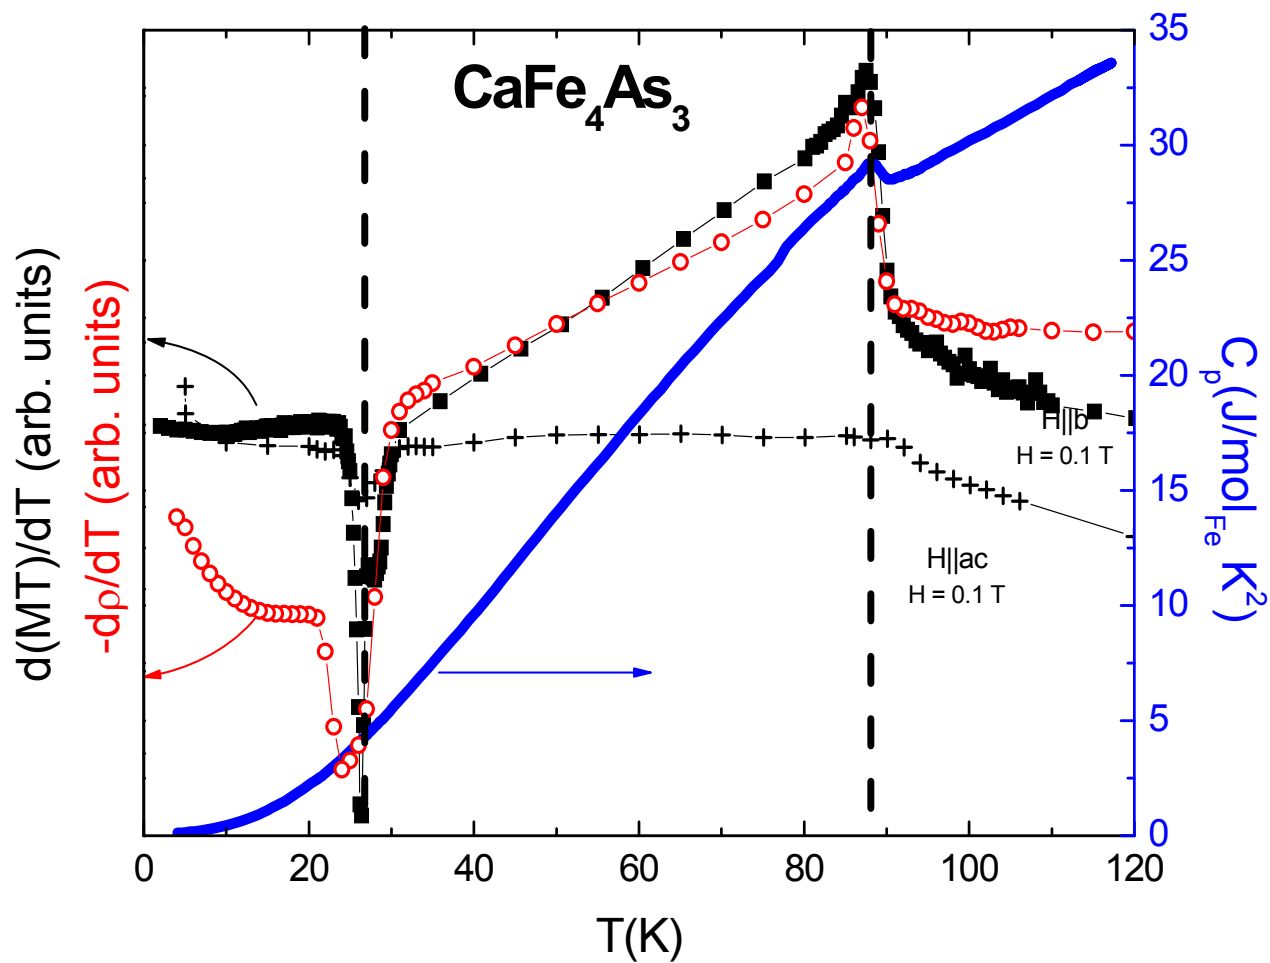

- Peak at  $T_N$  but no visible feature around low-T transition in  $C_p$
- $\gamma = 20 \text{ mJ}/(\text{mol}_{\text{Fe}} \text{ K}^2)$

- Linear  $C_p/T$  ( $T^2$ ) above  $T_2$
- High temperature ( $26 \text{ K} < T < 36 \text{ K}$ )  
 $\gamma^* = 20 \text{ mJ}/(\text{mol}_{\text{Fe}} \text{ K}^2)$

# CaFe<sub>4</sub>As<sub>3</sub>

# CaFe<sub>4</sub>As<sub>3</sub> – Kadowaki-Woods ratio

$0 < T < 15 \text{ K}$ :

- Electronic specific heat coefficient

- $\gamma \sim 20 \text{ mJ}/(\text{mol}_{\text{Fe}} \text{K}^2)$

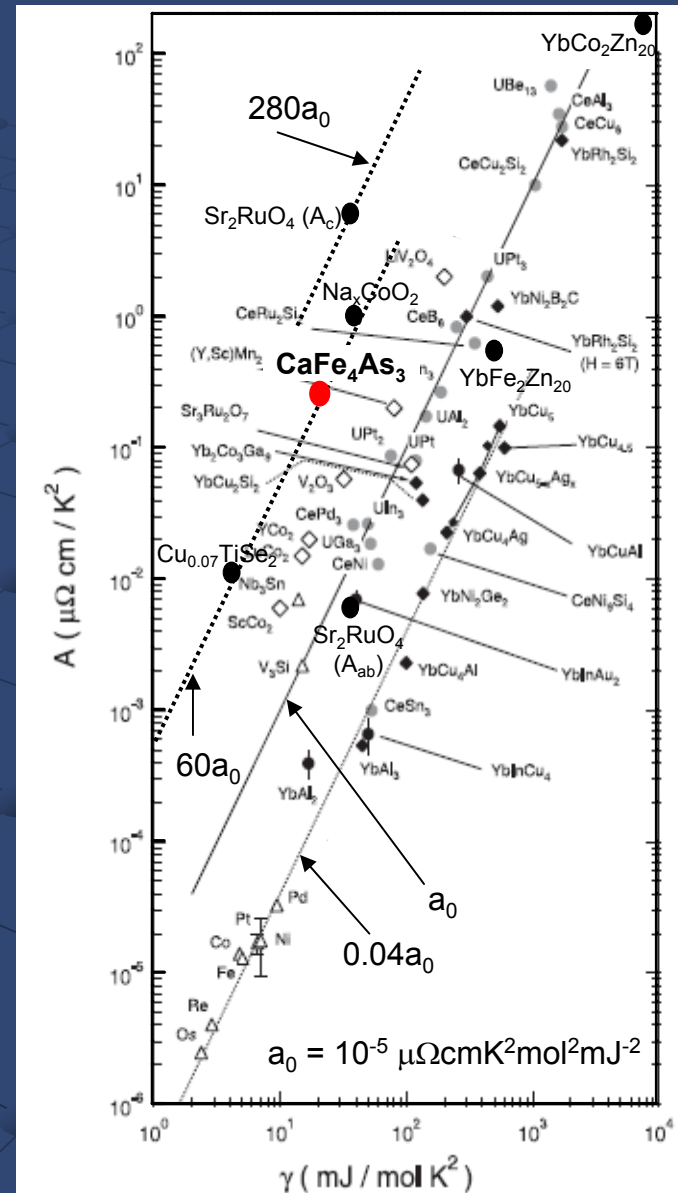

- Fermi liquid behavior:

- $\Delta\rho \sim AT^2$ ,  $A = 0.25 \mu\Omega \text{ cm}/\text{K}^2$

$$\text{KW} = A/\gamma^2 = 55 a_0$$

$$(a_0 = 10^{-5} \mu\Omega \text{ cm mol}^2 \text{K}^2 / \text{mJ}^2)$$

## CaFe<sub>4</sub>As<sub>3</sub> - next steps

- Doping and pressure studies
- Can SC be induced in this 3D “locally” layered structure?
- Is there FM coupling at low T?

# “Practical” superconductors

- *What we know:*
  1. Layered crystal structure
    - *Reduced anisotropy:  $\text{CaFe}_4\text{As}_3$*
  2. **Competing interactions: charge density wave and superconductivity –  $\text{Cu}_x\text{TiSe}_2$**

# CDW-to-SC transition in $Cu_xTiSe_2$

# *CDW-to-SC transition in $Cu_xTiSe_2$*

- *Layered dichalcogenides (S, Se, Te based compounds)*
  - Often display spin density wave, charge density wave transitions
  - Interesting physics, ground states can be tuned between different ground states
    - magnetic field
    - chemical doping
    - pressure

# *CDW-to-SC transition in $\text{Cu}_x\text{TiSe}_2$*

- CDW and superconductivity: competing collective electron states
- Tuning parameters (pressure, doping) used to study this competition in low-dimensional systems where both states existed
- No known system where chemical doping results in new superconducting state
- $\text{Cu}_x\text{TiSe}_2$ : first example of doping induced CDW-to-superconductivity transition

# Properties of $TiSe_2$

- ❖ Layered (2D) dichalcogenide
- ❖ Charge density wave (CDW) transition:  $T_{CDW} \approx 200$  K
- ❖ No incommensurate CDW
- ❖ Mechanism for the CDW formation – controversial

- Not driven by Fermi surface nesting
  - Exciton formation, indirect Jahn-Teller effect
- ❖ Resistivity very sensitive to non-stoichiometry and impurities

DiSalvo et al., Phys. Rev. B 14 (1976)

# Properties of pure $\text{TiSe}_2$

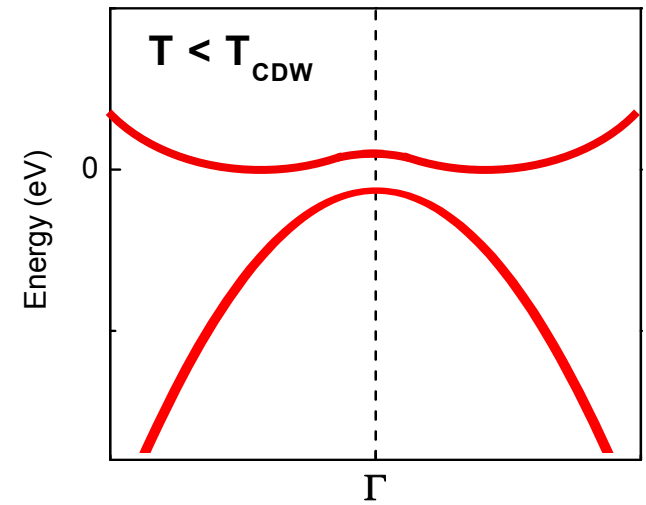

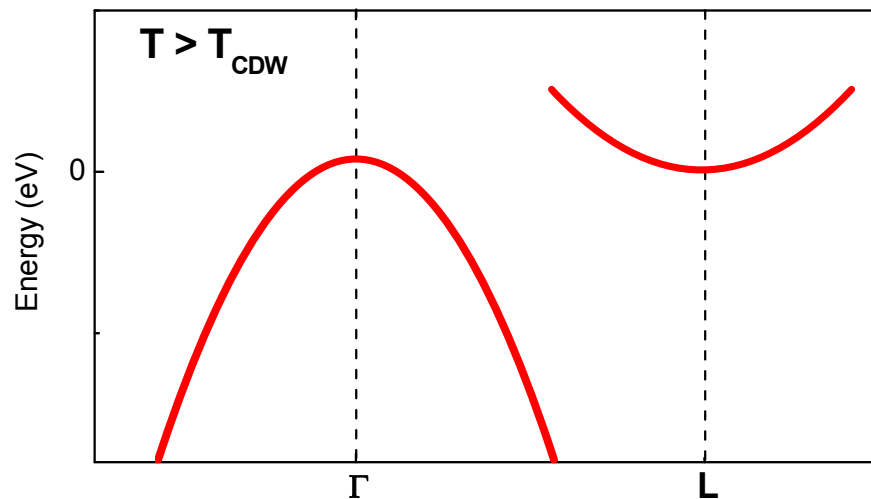

Normal state ( $T > T_{\text{CDW}}$ ): Semimetal or semiconductor ?

$T > T_{\text{CDW}}$

- small indirect gap

$T < T_{\text{CDW}}$

- Folding of L point at  $\Gamma$
- Larger indirect gap at different location in the Brillouin zone

# Properties of pure $\text{TiSe}_2$

## Normal state: **Semimetal** or **semiconductor** ?

# Cu doping of $\text{TiSe}_2$

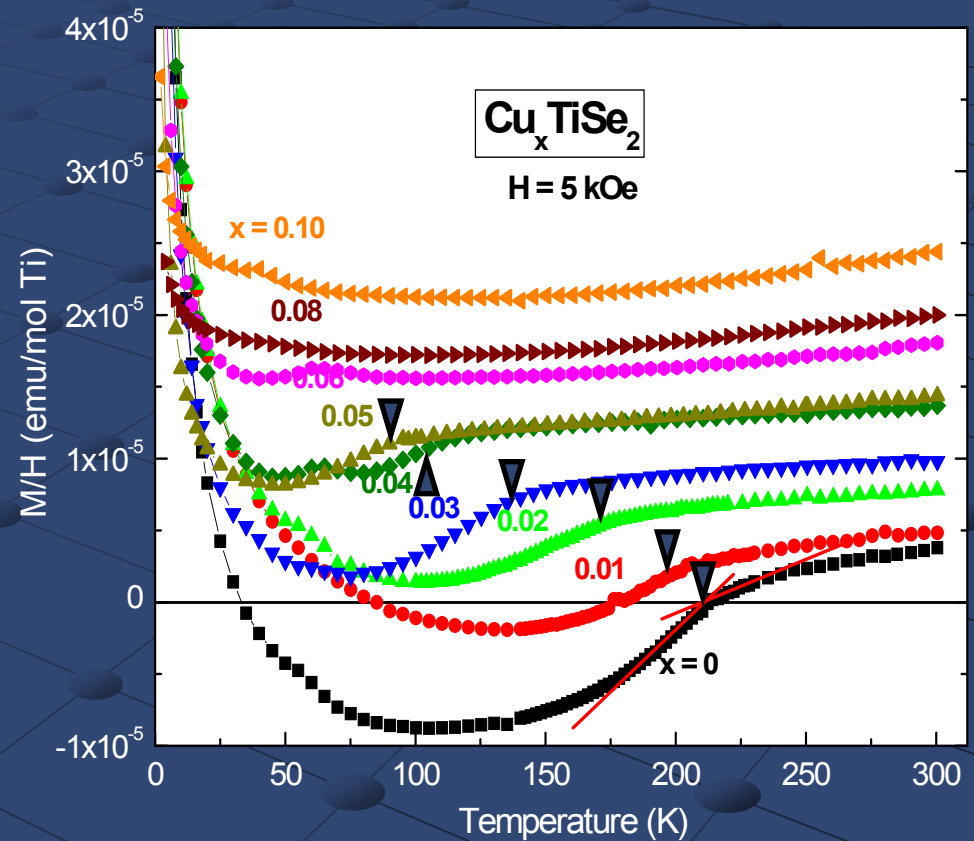

# $Cu_xTiSe_2$ ( $0 \leq x \leq 0.10$ )

Magnetic susceptibility drops on cooling through CDW transition

As  $x$  increases:

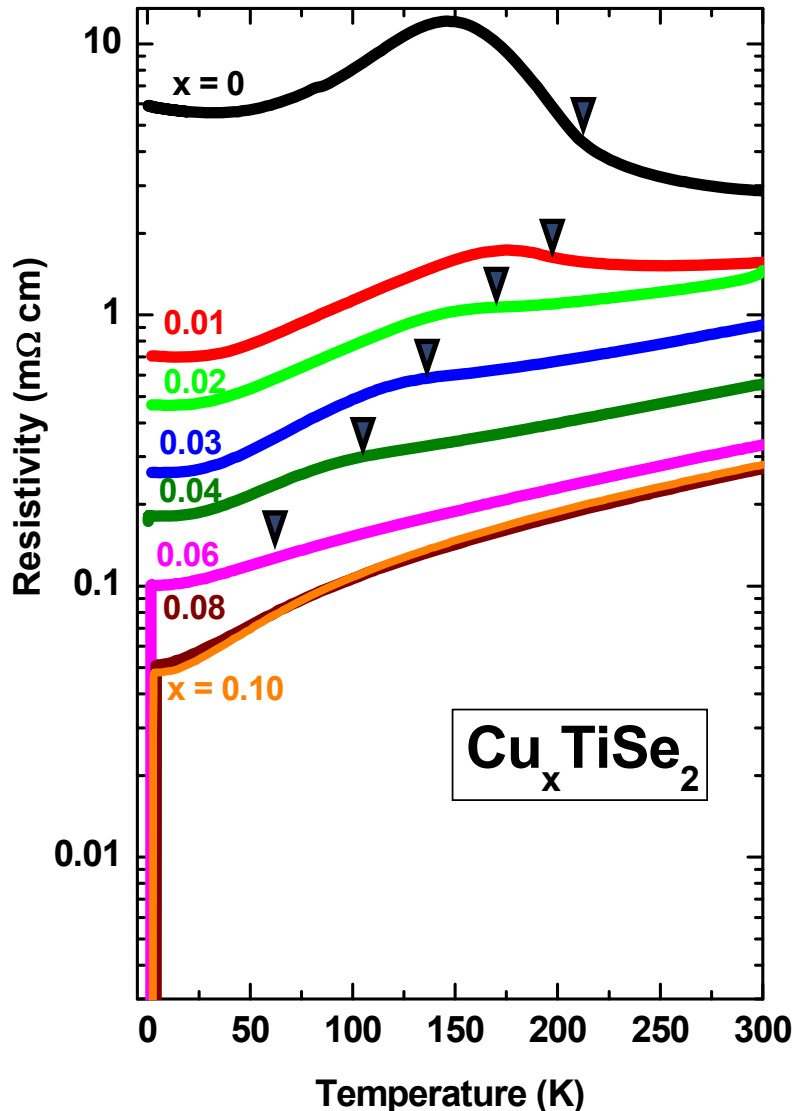

- $T_{CDW}$  decreases for  $x \leq 0.05$
- $\Delta\chi_{CDW}$  decreases for  $x \leq 0.05$
- $\chi_0$  increases

# $Cu_xTiSe_2$ ( $0 \leq x \leq 0.10$ )

As  $x$  increases:

- smaller  $\rho(T)$  values – more metallic
- $\rho(300K)/\rho(5K)$  increases
- decreasing  $\Delta\rho_{\text{peak}}$
- $T_{\text{CDW}}$  decreases for  $x \leq 0.06$
- superconductivity occurs for  $x \geq 0.04$
- $S < 0$  ( $x > 0$ ): electron doping

# The superconducting state in $\text{Cu}_x\text{TiSe}_2$

- Superconductivity exists for  $0.04 \leq x \leq 0.10$
- $T_c$  maximum for  $x = 0.08$ :  $T_c = 4.15 \text{ K}$

# $Cu_{0.08}TiSe_2$ heat capacity

- Normal state ( $T > T_c$ ):

$$C_p(T) = \gamma T + B T^3$$

$$\gamma = 4.3 \text{ mJ}/(\text{mol K}^2)$$

- The SC phase transition:

$$T_c = 4.15 \text{ K}$$

Heat capacity jump:

$$\Delta C_e(T_c)/(\gamma T_c) = 1.68$$

# $Cu_xTiSe_2$ (single crystals)

- Thin hexagonal plates
- Grown via  $I_2$  or excess Se vapor transport

vapor transport using  $CuCl_2$

# $\text{Cu}_{0.07}\text{TiSe}_2$ (single crystals) $H = 0$

$$T_c = 3.9 \text{ K}$$

$$\text{RRR} = 6.5$$

$$\text{High } T: \rho \propto T$$

$$\text{Low } T: \rho \propto T^2$$

# $\text{Cu}_{0.07}\text{TiSe}_2$ (single crystals): type II superconductor

 $H_{c2}$ 

 $H \parallel ab$ 
 $H_{c1}$ 

 $H \parallel c$ 

$$H \parallel ab$$

$$T = 0.35 \text{ K}: H_{c2}^{ab} = 1.25 \text{ T}$$

$$H_{c2}^{ab} \text{ and } H_{c2}^c \text{ decrease with } T$$

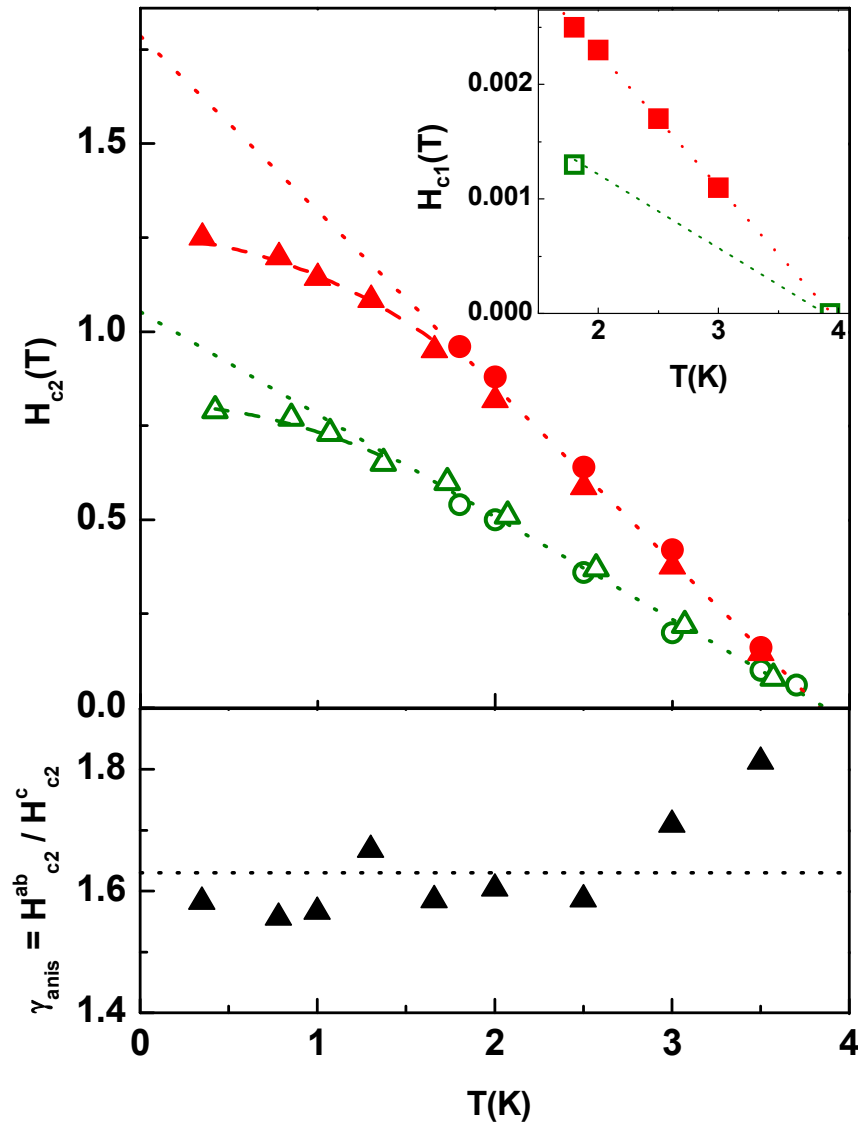

$$H \parallel c$$

$$H_{c2}^c = 0.7 \text{ T}$$

# $\text{Cu}_{0.07}\text{TiS}_2 H_c - T$ phase diagram

$T \approx 0$

(Bardeen-Cooper-Schrieffer BCS)

$$H_c(T) \approx H_c(0) [1 - 1.07 (T/T_c)^2]$$

$T \approx T_c$

(Werthamer-Helfand-Hohenberg WHH)

$$H_{c2}(0) \approx 0.693 H_{c2}^*(0)$$

$$H_{c2}^*(0) = - (dH_{c2}/dT)_{T_c} T_c$$

$H_{c2}$  anisotropy:  $\gamma_{\text{anis}} = H_{c2}^{\text{ab}} / H_{c2}^{\text{c}}$

$$\gamma_{\text{anis}} \approx 1.6$$

almost  $T$  independent

# Anisotropic Ginzburg – Landau theory

$$H_{c2}^{ab} = \Phi_0 / (2\pi \xi_{ab} \xi_c)$$

$$\Rightarrow \xi_{ab}, \xi_c$$

$$H_{c2}^c = \Phi_0 / (2\pi \xi_{ab}^2)$$

$$H_{c2}^i / H_{c1}^i = 2 \kappa_i^2 / \ln \kappa_i$$

$$\Rightarrow \kappa_{ab}, \kappa_c$$

$$\kappa_c = \lambda_{ab} / \xi_{ab}$$

$$\Rightarrow \lambda_{ab}, \lambda_c$$

$$\kappa_{ab} = [\lambda_{ab}(0) \lambda_c(0) / \xi_{ab}(0) \xi_c(0)]^{1/2}$$

J. R. Clem, *Physica C* **162-164** (1989)

	$T_c$ (K)	$\rho_0$ ( $\mu\Omega cm$ )	RRR	$H_{c2}(0)$ (T)	$\xi(0)$ (nm)	$H_{c1}^*(0)$ (Oe)	$\gamma_{anis}(0)$	$\kappa(0)$	$\lambda(0)$ (nm)
$H // ab$				1.238	21.3	32		25	285
$H    c$				0.729	12.5	53		13.4	584
	3.9	80	6.5		$\xi_{ab} / \xi_c \approx 1.7$		1.7		$\lambda_c / \lambda_{ab} \approx 2$

# $Cu_xTiSe_2$

## • How does SC arise?

- 2D to 3D transition
- change in electron count
- melting of the CDW by disorder

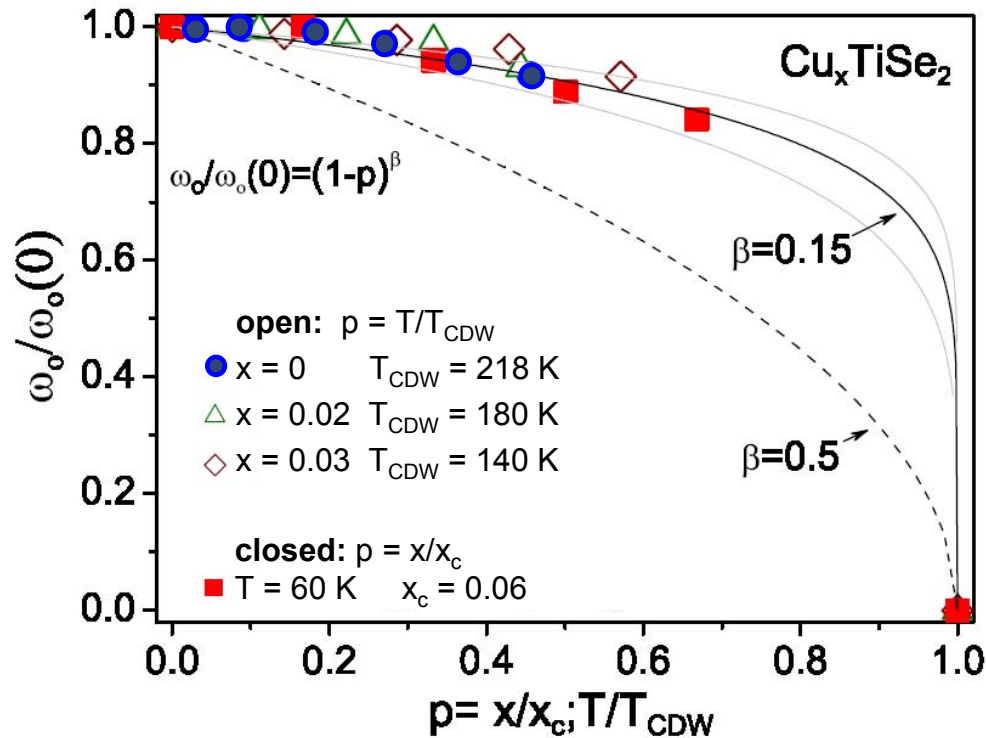

- What happens below  $T_c$  and  $0.04 < x < 0.07$ ?

# $\text{Cu}_x\text{TiSe}_2$ – Raman spectroscopy

$\omega_0$  - CDW amplitude mode frequency

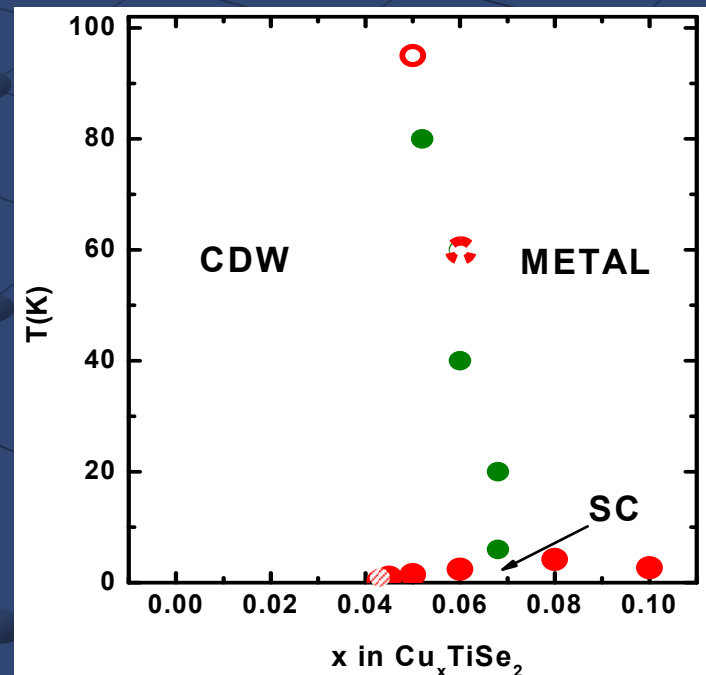

- CDW phase boundary  $x_c(T)$  extends below SC dome

- Identical **composition** and **thermal mode softening**

$$\omega_0/\omega_0(0) = (1-p)^\beta$$

$$p = x/x_c \text{ or } T/T_{\text{CDW}}$$

$$\beta \sim 0.15$$

# $\text{Cu}_x\text{TiSe}_2$

- ❖ CDW transition driven down with Cu doping
- ❖ SC emerges for  $x \geq 0.04$
- ❖ CDW and SC coexist for  $0.04 < x < 0.06$
- ❖  $T_C = 4.15$  K maximum for  $x = 0.08$

## Cu doping of $TaS_2$

- many known polytypes
- $2H - TaS_2$ : superconductivity  $T_c \sim 0.8$  K
- commensurate CDW state below  $T_{CDW} \sim 75$  K
- some differences with  $Cu_xTiSe_2$

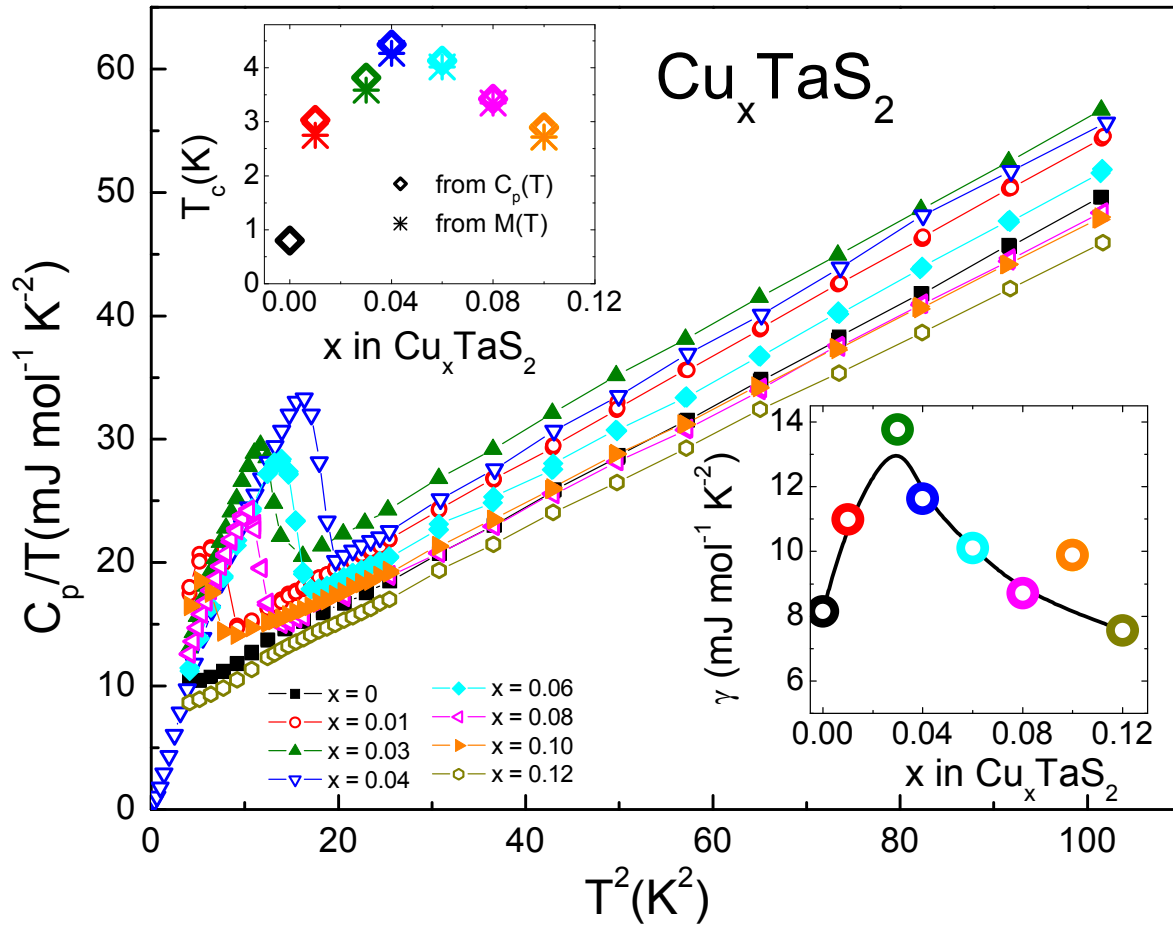

# $\text{Cu}_x\text{TaS}_2$

- $\rho(T)$  values decrease with Cu-doping
- non-monotonic  $x$ -dependence of  $T_c$
- optimal composition for SC:  $x \approx 0.04$

- $T_c$  vs.  $x$  – max at  $x = 0.04$
- non-monotonic  $x$ -dependence of  $\gamma$

## Comparison between $\text{Cu}_x\text{TiSe}_2$ and $\text{Cu}_x\text{TaS}_2$

### 1T - $\text{TiSe}_2$ :

- commensurate CDW
  - $T_{\text{CDW}} = 220 \text{ K}$
  - no FS nesting
- no superconductivity (SC)

### $\text{Cu}_x\text{TiSe}_2$

- increasing  $x$ : monotonous increase in
  - lattice parameters
  - electronic specific heat coefficient  $\gamma$
  - $M(300\text{K})$
- SC occurs for  $x \geq 0.04$
- $x_{\text{optimum}} = 0.08$ :
  - $T_c = 4.15 \text{ K}$
  - $H_{c2} = 1.28 \text{ T}$

### 2H - $\text{TaS}_2$ :

- more conventional CDW:
  - incommensurate
  - $T_{\text{CDW}} = 75 \text{ K}$
  - FS nesting
- superconductivity:  $T_c = 0.8 \text{ K}$

### $\text{Cu}_x\text{TaS}_2$

- increasing  $x$ :
  - lattice parameters increase
  - $\gamma = \text{max around } x_{\text{optimum}} = 0.04$
- $T_c$  almost triples for  $x = 0.01$
- $x_{\text{optimum}} = 0.04$ :
  - $T_c = 4.45 \text{ K}$
  - $H_{c2} = 4.9 \text{ T}$

## Conclusions and outlook

- Numerous possibilities to try and design of new, practical superconductors:
  - use “Fe-As” and blocking B layers to build new crystal structures
  - reduce anisotropy by pressure, doping, coupled “Fe-As” layers, “locally layered” structures (CaFe<sub>4</sub>As<sub>3</sub>- type)
- Doping as tuning parameter between competing ground states in known layered materials
  - CDW-to-SC induced transition in layered dichalcogenides: Cu<sub>x</sub>TiSe<sub>2</sub>, Cu<sub>x</sub>TaS<sub>2</sub>
