Top-Down vs. Bottom-Up

Forward-Induction vs. Backward Induction

Principal-Agent Model: Nuptial Gifts and Courtship Feeding

$$W_f = N + C - MC + W_{fo}$$

$$W_m = sMC - fC^2 - gN \geq W_{mo}$$

W_f	Female Fitness Increment
N	Nuptial Gift
C	Courtship Feeding
MC	Payment Expended for Feeding
W_{fo}	Female Outside Option
W_m	Male Fitness Increment
sMC	Payment Received for Feeding
fC^2	Foraging Cost of Courtship Food
gN	Cost of Nuptial Gift
W_{mo}	Male Outside Option

Principal-Agent Courtship Without Outside Options

$$s \rightarrow 1, f \rightarrow 1/2, g \rightarrow 1, W_{fo} \rightarrow 0, W_{mo} \rightarrow 0$$

Principal-Agent Courtship
Both With Outside Options

Condition for Continued Pairing

$$T_f = N + C + W_{fo}$$

$$T_m = sMC$$

$$P_f = W_{fo}$$

$$P_m = W_{mo}$$

$$B_f = W_{f,nbs,mo}$$

$$B_m = W_{m,nbs,mo}$$

T Temptation to Defect

P Punishment

B Benefit to Continued Pairing

$$\begin{aligned}W_{f,divorce,\infty}(L) &= T_f + LP_f + L^2P_f \dots \\ &= T_f + P_f \sum_{i=1}^{\infty} L^i = T_f + P_f \frac{L}{1-L}\end{aligned}$$

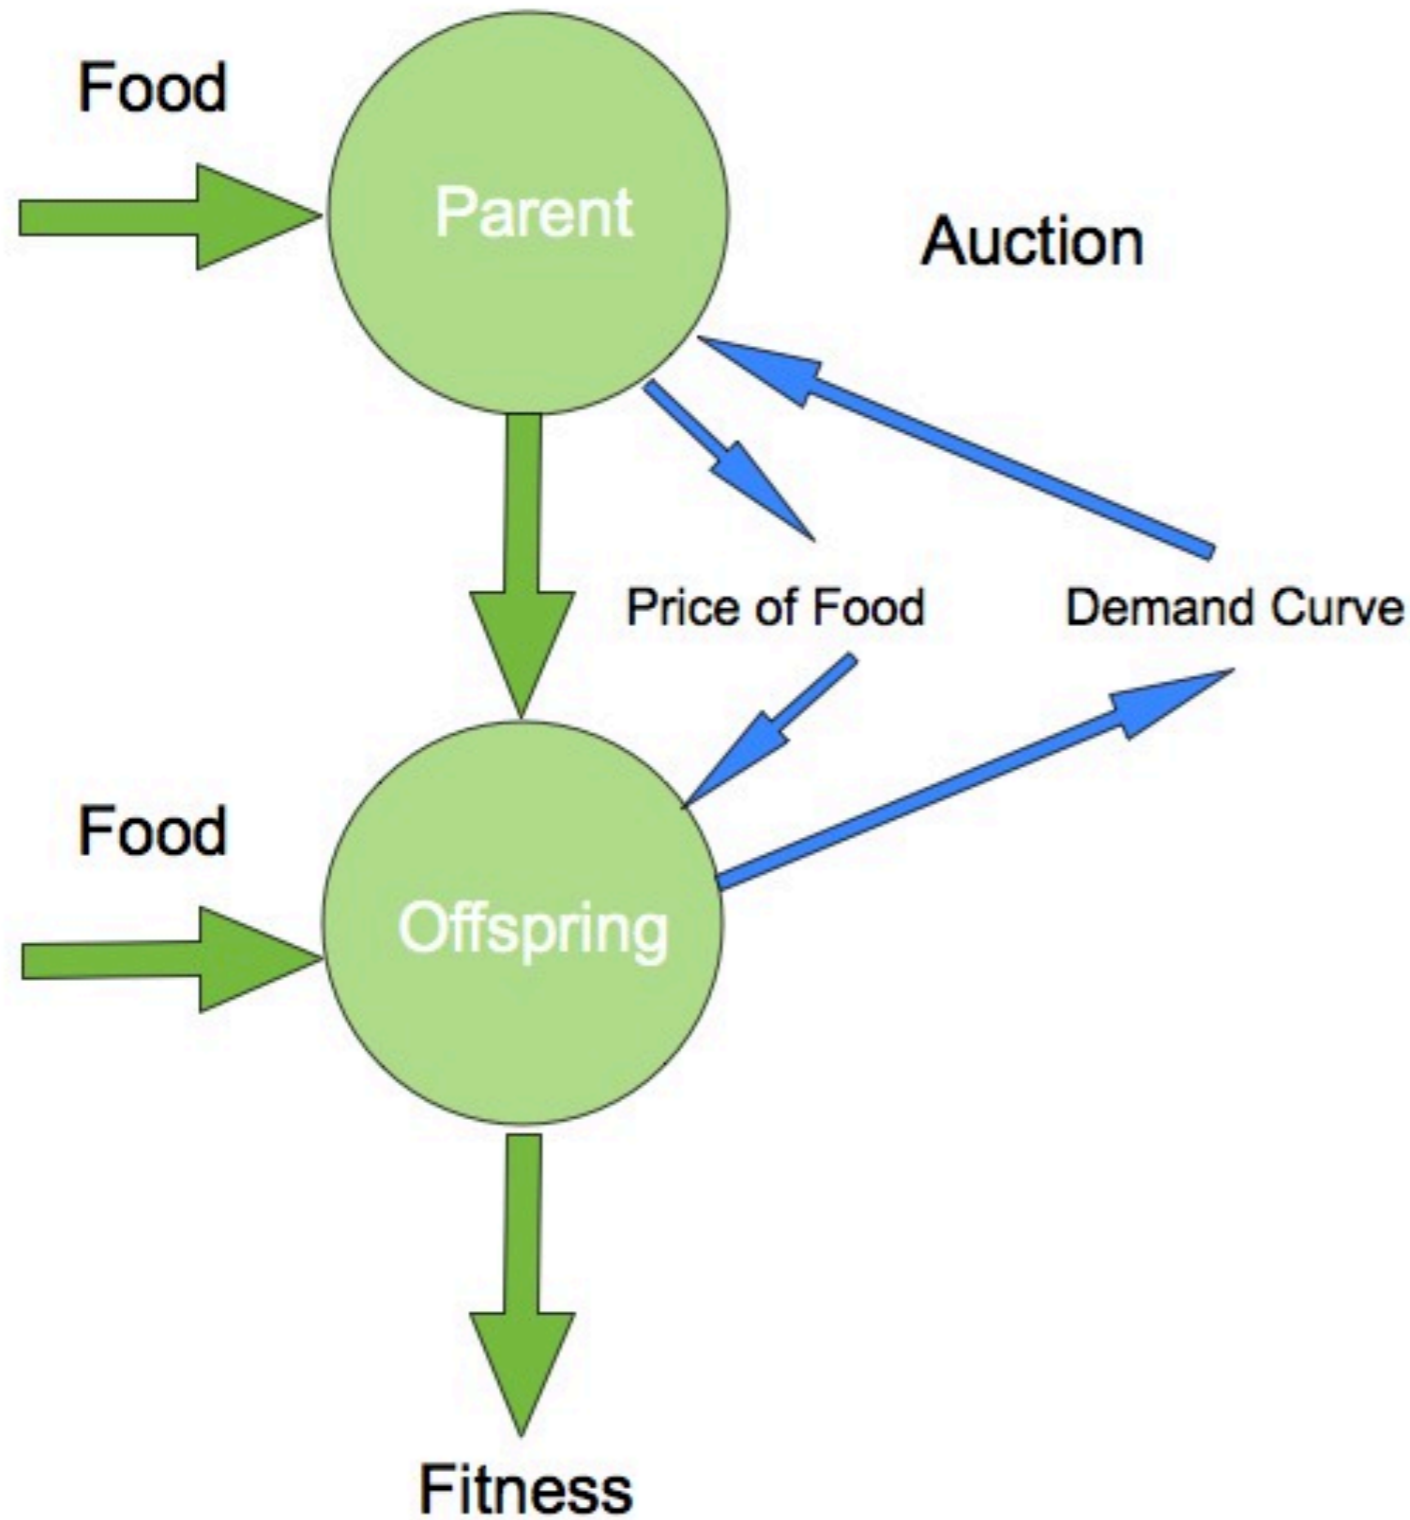

$$\begin{aligned}W_{f,pair,\infty}(L) &= B_f + LB_f + L^2B_f \dots \\ &= B_f \sum_{i=0}^{\infty} L^i = B_f \frac{1}{1-L}\end{aligned}$$

Threshold Daily Survival for Continued Pairing

$$L_{f,min,\infty} = \frac{T_f - B_f}{T_f - P_f}$$

$$L_{m,min,\infty} = \frac{T_m - B_m}{T_m - P_m}$$

Evolutionary Tier

Genetical Dynamics

A2A2 x A2A2

		Cyan	
		1	2
Red	1	(3,4)	(11,3)
	2	(5,6)	(1,-2)

A1A1 x A1A1

		Cyan	
		1	2
Red	1	(2,6)	(10,5)
	2	(4,8)	(0,0)

$$p_{t+1} = \frac{a_1}{a_1 + a_2}$$

Evolution results in payoff matrix that is ESS,
from which behavior emerges.
