Accelerator Frontier

Frontier Conveners

Name	Institution	email
Steve Gourlay	Lawrence Berkeley National Laboratory	sagourlay[at]lbl.gov
Tor Raubenheimer	SLAC National Accelerator Laboratory	tor[at]slac.stanford.edu
Vladimir Shiltsev	Fermi National Accelerator Laboratory	shiltsev[at]fnal.gov

Description

The Accelerator Frontier activities include discussions on high-energy hadron and lepton colliders, high-intensity beams for neutrino research and for the “Physics Beyond Colliders”, accelerator technologies, science, education and outreach as well as the progress of core accelerator technology, including RF, magnets, targets and sources. Participants will submit LOL, contributed papers, take part in corresponding workshops and events, contribute to writing summaries and take part in the general Snowmass'21 events.

Each AF Working group will address the overall questions:

1. What is needed to advance the physics?
2. What is currently available (state of the art) around the world?
3. What new accelerator facilities could be available on the next decade (or next next decade)?
4. What R&D would enable these future opportunities?
5. What are the time and cost scales of the R&D and associated test facilities as well as the time and cost scale of the facility?

White papers in TF in this area

TF7: collider phenomenology

TOPIC	AUTHORS
Observables	
Geometric strategies for collider data analysis	Jesse Thaler (MIT)
Theoretical perspective on machine learning for data analysis	Andrew Larkoski (Reed)
New developments in kinematic observables	Doojin Kim (Texas A&M)
New kinematic representations of jets and events	Tao Liu (HKUST)
Calculations	
Interface of theory calculations with experimental methods	Simone Marzani (Genova)
Electroweak at very high energy and EW parton showers	Tao Han (Pittsburg)
Needs and trends in QED resummation	Stefano Frixione (Genova), Eric Laenen (NIKHEF)
Factorization	George Sterman (Stony Brook)
Higher order QCD calculations inspired by aspects of	No coordinator identified yet
Generators	
NNLO+NNLL event generators	Giulia Zanderighi (Munich)
First-principles simulations with machine learning	Tilman Plehn (Heidelberg)

TF2: EFT techniques

TOPIC	AUTHORS
Constraints on IR physics from UV consistency	Matt Reece
EFT of dark matter	Mikhail Solon
HEP/CMT connections	Riccardo Penco
Naturalness	Nathaniel Craig
EFTs of gravity	Walter Goldberger
SMEFT	Will Shepherd
EFT of cosmology (with TF09)	Mehrdad Mirbabayi and Marko Simonovic

TF8: model building

TOPIC	AUTHORS	TITLE
Anomaly detection with machine learning		
Opportunities for theory studies with public collider	David Curtin, Eric Kuflik, Yonit Hochberg, Neal Weiner, and Keisuke Harigaya	
Fully differential likelihood techniques	Patrick Draper, Isabel Garcia-Garcia, Matthew Reece	
BSM Signatures		
Ultra-exotics and forgotten signatures at colliders	Wolfgang Altmannshofer, Jure Zupan	
Model dependent vs. model independent approach	Brian Batell, Chris Verhaaren	
	Graham Kribs, Ethan Neil	
	Prateek Agrawal, JiJi Fan, Anson Hook, Junwu Huang, Gustavo Marques Tavares	
	Kaladi Babu, Marco Drewes, Julia Gehrlein (?)	
	Gilly Elor, Seyda Ipek	
	Claudia Frugiuele, Gilad Perez	

TF6: theory techniques for precision physics

TOPIC	Author	TITLE
The path to N3LO precision	Fabrizio Caola, Claude Duhr, Xiaohui Liu, Frank Petriello, Stefan Weinzierl	
Future prospects for parton showers	Simone Alioli, Zoltan Nagy, Dave Soper, Bryan Webber	
Theoretical developments in the SMEFT at dimension-8 and beyond	Alioli, Durieux, Martin, Melia, Mereghetti, Murayama, Murphy, Petriello, Shadmi, Shepherd et al	
Proton structure at the precision frontier (with EF06)	Alekhin, Ball, Blumlein, Cooper-Sarkar, Forte, Nadolsky, Thorne, Ubiali, Yuan, et al	
Resummation for future colliders	Thomas Becher, Andrea Ferroglia, Xiaohui Liu, Alexandre Penin, Felix Ringer, Robert Szafron et al	
Flavor model building (with TF08)	Wolfgang Altmannshofer, Jure Zupan	

Focus: theoretical techniques

[Full list of white papers](#)

Theory and future collider

- No dedicated discussion on the experimental (accelerator) facilities within the TF.
 - ▶ More in the energy frontier.

Involvement of theory

- No dedicated discussion on the experimental (accelerator) facilities within the TF.
 - ▶ More in the energy frontier.

At the same time:

- Future collider has been a focus for many theorists.

Many accelerator related activities in Snowmass 21

Snowmass Agora on Future Colliders: Muon Colliders

February 16, 2022
US/Central timezone

Overview **Snowmass Agora #3 on Future Colliders: Muon Colliders will held on 16 February, 2022. Please**

Snowmass Agora on Future Colliders: Circular e+e- Colliders

January 19, 2022
US/Central timezone

Overview **Snowmass Agora #2 on Future Colliders: Circular e+e- Colliders will held on 19 January, 2022. Please register for the event to receive the ZOOM link to attend. The registration will be open throughout the event.**

conferences@fnal.gov

In the context of the Snowmass 2021 Community Planning Exercise, the Accelerator and Energy Frontiers are pleased to announce a series of events, intended for all Snowmass participants, to critically discuss physics and technical aspects of different HEP collider concepts.

The events will be hosted by the Future Colliders initiative at Fermilab. The plan is to discuss both near and far future collider proposals, in different stages of development, synergistically grouped into five categories:

- **Linear e+e- colliders**
- **Circular e+e- colliders**
- **Muon colliders**
- **Circular pp and ep**
- **Advanced colliders**

The events will take place once a month from December 2021 till April 2022, on Wednesdays 3-5 p.m. CST. The detailed agenda will be announced soon. We request you to please save the following dates:

- Dec. 15, 2021
- Jan. 19, 2022
- Feb. 16, 2022
- Mar. 16, 2022
- Apr. 13, 2022

A "Collider discussion" will be further organized during the **Energy Frontier Meeting** planned for the week of March 28.

These events are meant to be focused critical discussions of classes of colliders that share similar concepts, and will have to specifically address both physics and feasibility considering aspects such as:

Active participation and contribution from many theorists

Theorists -> AF: physics studies

- Theorists contribute: first looks, estimates, pheno studies.
- Available studies.
 - ▶ European Strategy updates
 - ▶ CDR/TDR: ILC/CLIC/CEPC-SppC/FCC(hh, ee, eh)
 - ▶ muon collider forum + studies
- Still needed to do more.
 - ▶ photon collider, ep...

The rest of my talk

- Review the collider options which have been put forward.
- Briefly summarizes the physics cases have been laid out (so far).

The rest of my talk

- Review the collider options which have been put forward.
- Briefly summarizes the physics cases have been laid out (so far).

List of proposals

Snowmass 2021 Energy Frontier Collider Study Scenarios

Collider	Type	\sqrt{s}	P [%] e^-/e^+	L_{int} ab^{-1}
FCC-hh	pp	100 TeV		30
LHeC	ep	1.3 TeV		1
FCC-eh	ep	3.5 TeV		2
muon-collider (higgs)	$\mu\mu$	125 GeV		0.02
High energy muon-collider	$\mu\mu$	3 TeV		1
		10 TeV		10
		14 TeV		20
		30 TeV		90

Note for muon-collider: It is important to note that the plan is not to run subsequently at the various c.o.m etc. These are reference points to explore and assess the physics potential and technology. The luminosity can be varied to determine how best to exploit the physics potential.

Other options to explore:

- Muon collider at a very high energy (>30 TeV?)[Need to consolidate g list of c.o.m. energies]
- FCC pp >200 TeV? and ~75 TeV documenting sensitivity loss
- Very high energy e+e- collider
- Other emerging ideas: $\gamma\text{-}\gamma$ collider, C^3 e^+e^- collider [C3=Cool Copper Collider]

M. Narain. Energy frontier restart workshop.

ITF will present

Possible Higgs factory comparison table

Proposal Name	Nominal COM energy (Range) [TeV]	Luminosity per IP at nominal COM energy [$10^{34} \text{ cm}^{-2} \text{ s}^{-1}$]	Years of pre-construction R&D required	Construction cost range, including explicit labor [2021 MUS\$]	Estimated operating electric power consumption [MW]
FCC-ee	0.24 (0.09 - 0.37)	8.5			
CEPC	0.24 (0.09 - 0.24)	2.9			
ILC (Higgs factory)	0.25 (0.09 - 3)	1.35			
CCC (Cryo Cooled Collider)	0.25 (0.25 - 0.55)	1.3			
CLIC (Higgs factory)	0.38 (0.09 - 0.38)	1.5			
CERC (ERL ee collider)	0.24 (0.09 - 0.6)	78			
ReLiC (Linear ERL Collider)	0.24 (0.09 - 1.0)	115			
ERLC (ERL Linear Collider)	0.25	100			
XCC FEL-based $\gamma\gamma$ Collider	0.125 (0.125 - 0.14)	0.1			
Circular ee Fermi site filler	0.24	1.2			
TWLC Fermi site filler	0.25	1.4			
MC (Higgs factory)	0.13	0.01			

The rest of my talk

- Review the collider options which have been put forward.

- Briefly summarizes the physics cases have been laid out (so far).

Frontiers: smaller distances

Tao Han: everything has a factory, Higgs needs one too!

Frontiers: smaller distances

Tao Han: everything has a factory, Higgs needs one too!

We all agree.

At the same time, useful to say more about the physics questions we would like these facilities to address.

Theorists → AF: physics goals

- Good consensus in the community.
 - ▶ Main physics drivers: Higgs, dark matter.
- Higgs.
 - ▶ couplings: precision measurement
 - ▶ naturalness: direct production (higher energy)
- Dark matter
 - ▶ WIMP: higher energy
 - ▶ dark sector: intensity
- Rich physics program: portals, flavor physics, QCD, QFT tests, ...

Theorists → AF: physics goals

- Dark matter
 - ▶ WIMP: higher energy
 - ▶ dark sector: intensity
- Rich physics program: portals, flavor physics, QCD, QFT tests, ...

No guarantee to discover new particles, of course.
But, we will learn a lot.

At Higgs factories: Precision scale (very roughly) with (# of Higgs)^{-1/2}

Low energy Higgs factories (Zh)

High energy (> 600 GeV) lepton colliders (WW fusion)

Sensitive to different couplings.

Measurement at lepton collider more model independent: width, Zh coupling, ...

Tera Z (and ttbar threshold) can improve significantly other EW precision measurements.

Higgs self-coupling

Higgs@FC WG September 2019

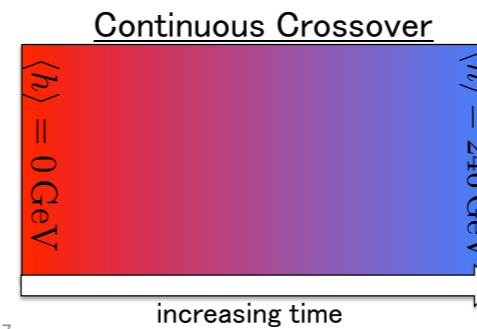

A few percent accuracy would cover most of the ground.

Higher energy collider needed:

TeV lepton collider, 100 TeV pp collider

Lesson: nature of EW phase transition

Which one is the right picture?

Precision Higgs measurements can reveal a lot

Reach of the top partners

Briefing book + my drawings.

All Colliders: Top squark projections
(R-parity conserving SUSY, prompt searches)

Reach for other top partners similar

Hadron collider reach $\approx 10\%$ of E_{CM}
Weaker if new physics without strong int.

Lepton collider reach $\approx 0.5 \times E_{CM}$
Reach for other new physics similar.
Photon collider similar, but only for produce charged particles.

Motivated by the naturalness puzzle

Theorists → AF: physics goals

- Good consensus in the community.
 - ▶ Main physics drivers: Higgs, dark matter.
- Higgs.
 - ▶ couplings: precision measurement
 - ▶ naturalness: direct production (higher energy)
- Dark matter
 - ▶ WIMP: higher energy
 - ▶ dark sector: intensity
- Rich physics program: portals, flavor physics, QCD, QFT tests, ...

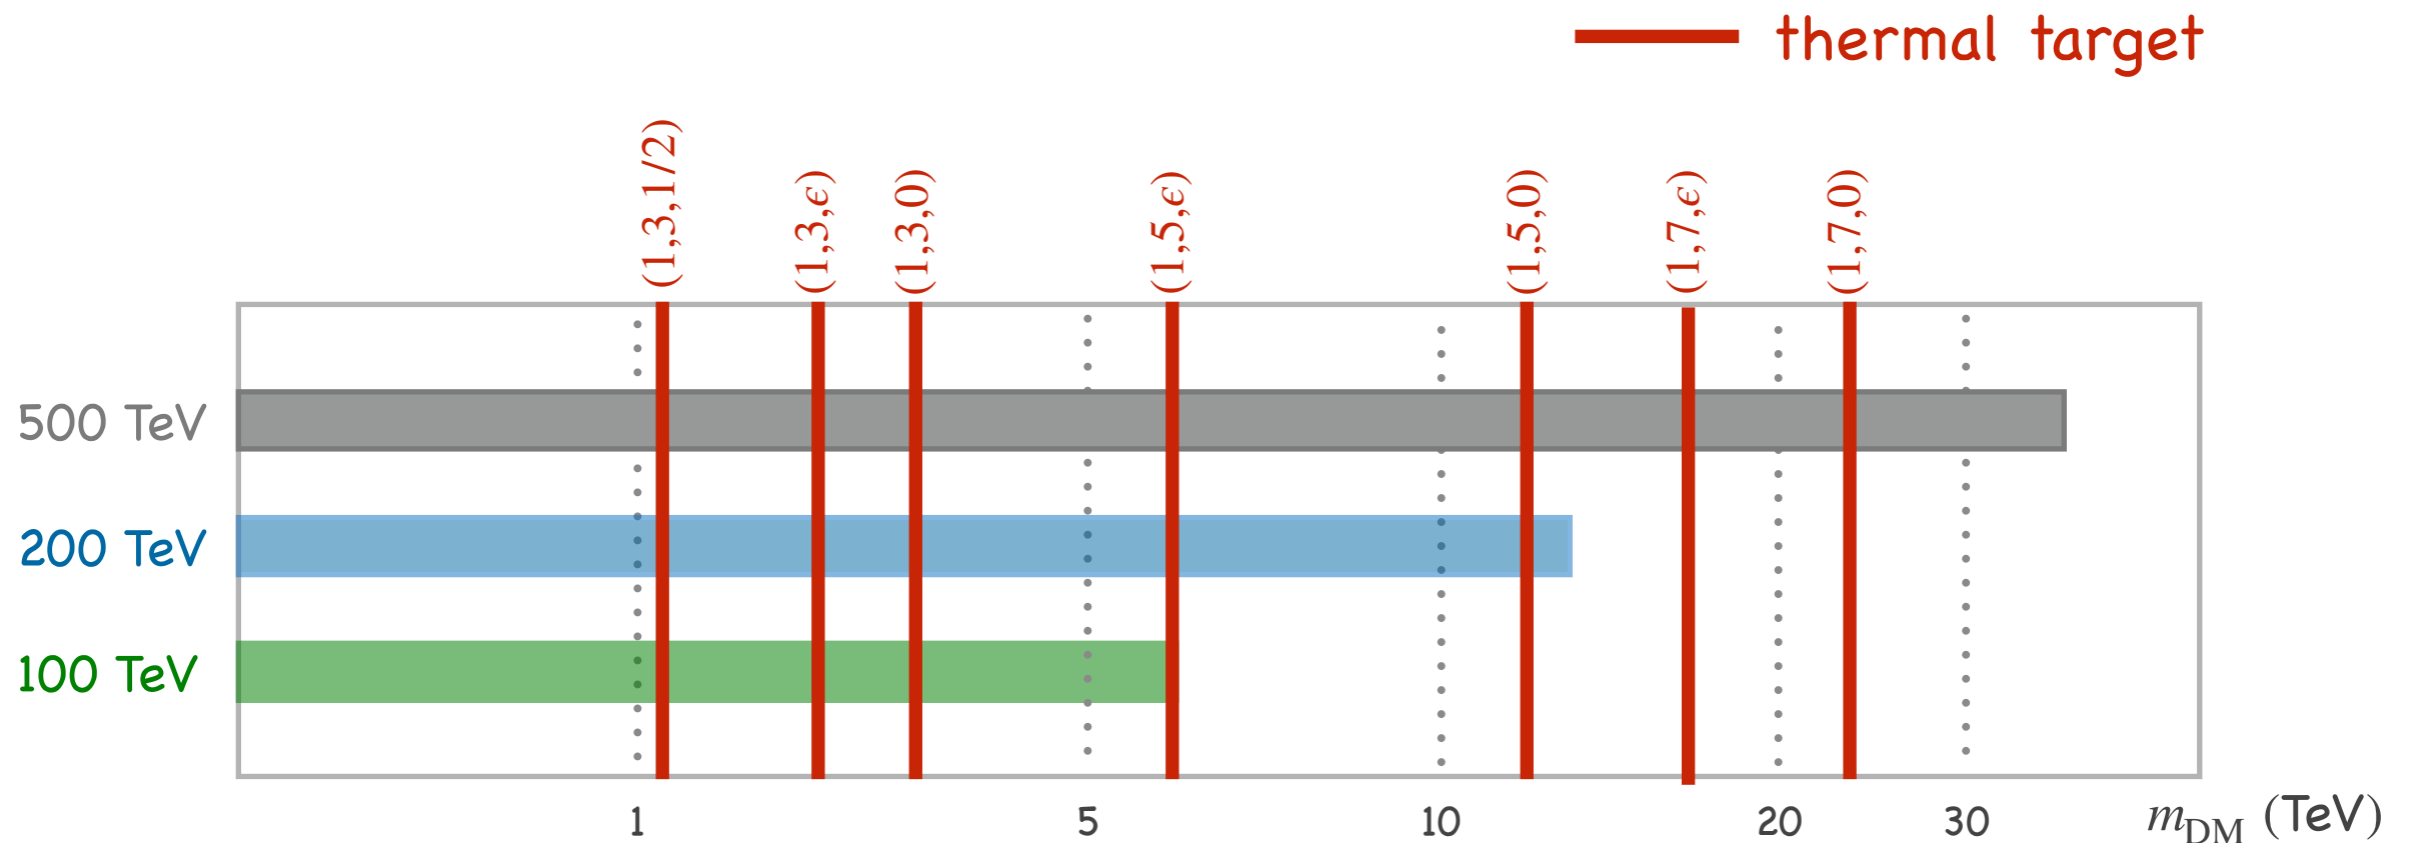

WIMP Dark matter

Model (color, n , Y)		Therm. target
(1,2,1/2)	Dirac	1.1 TeV
(1,3,0)	Majorana	2.8 TeV
(1,3, ϵ)	Dirac	2.0 TeV
(1,5,0)	Majorana	11 TeV
(1,5, ϵ)	Dirac	6.6 TeV
(1,7,0)	Majorana	23 TeV
(1,7, ϵ)	Dirac	16 TeV

The simplest WIMP model: DM part of EW multiplet.
 Interaction: Standard Model gauge interactions.

EW Dark matter reach: pp collider

Higher energy needed to cover higher dimensional multiplets.

Either discovery or exclusion, we can make a clear statement of this very compelling WIMP DM scenario.

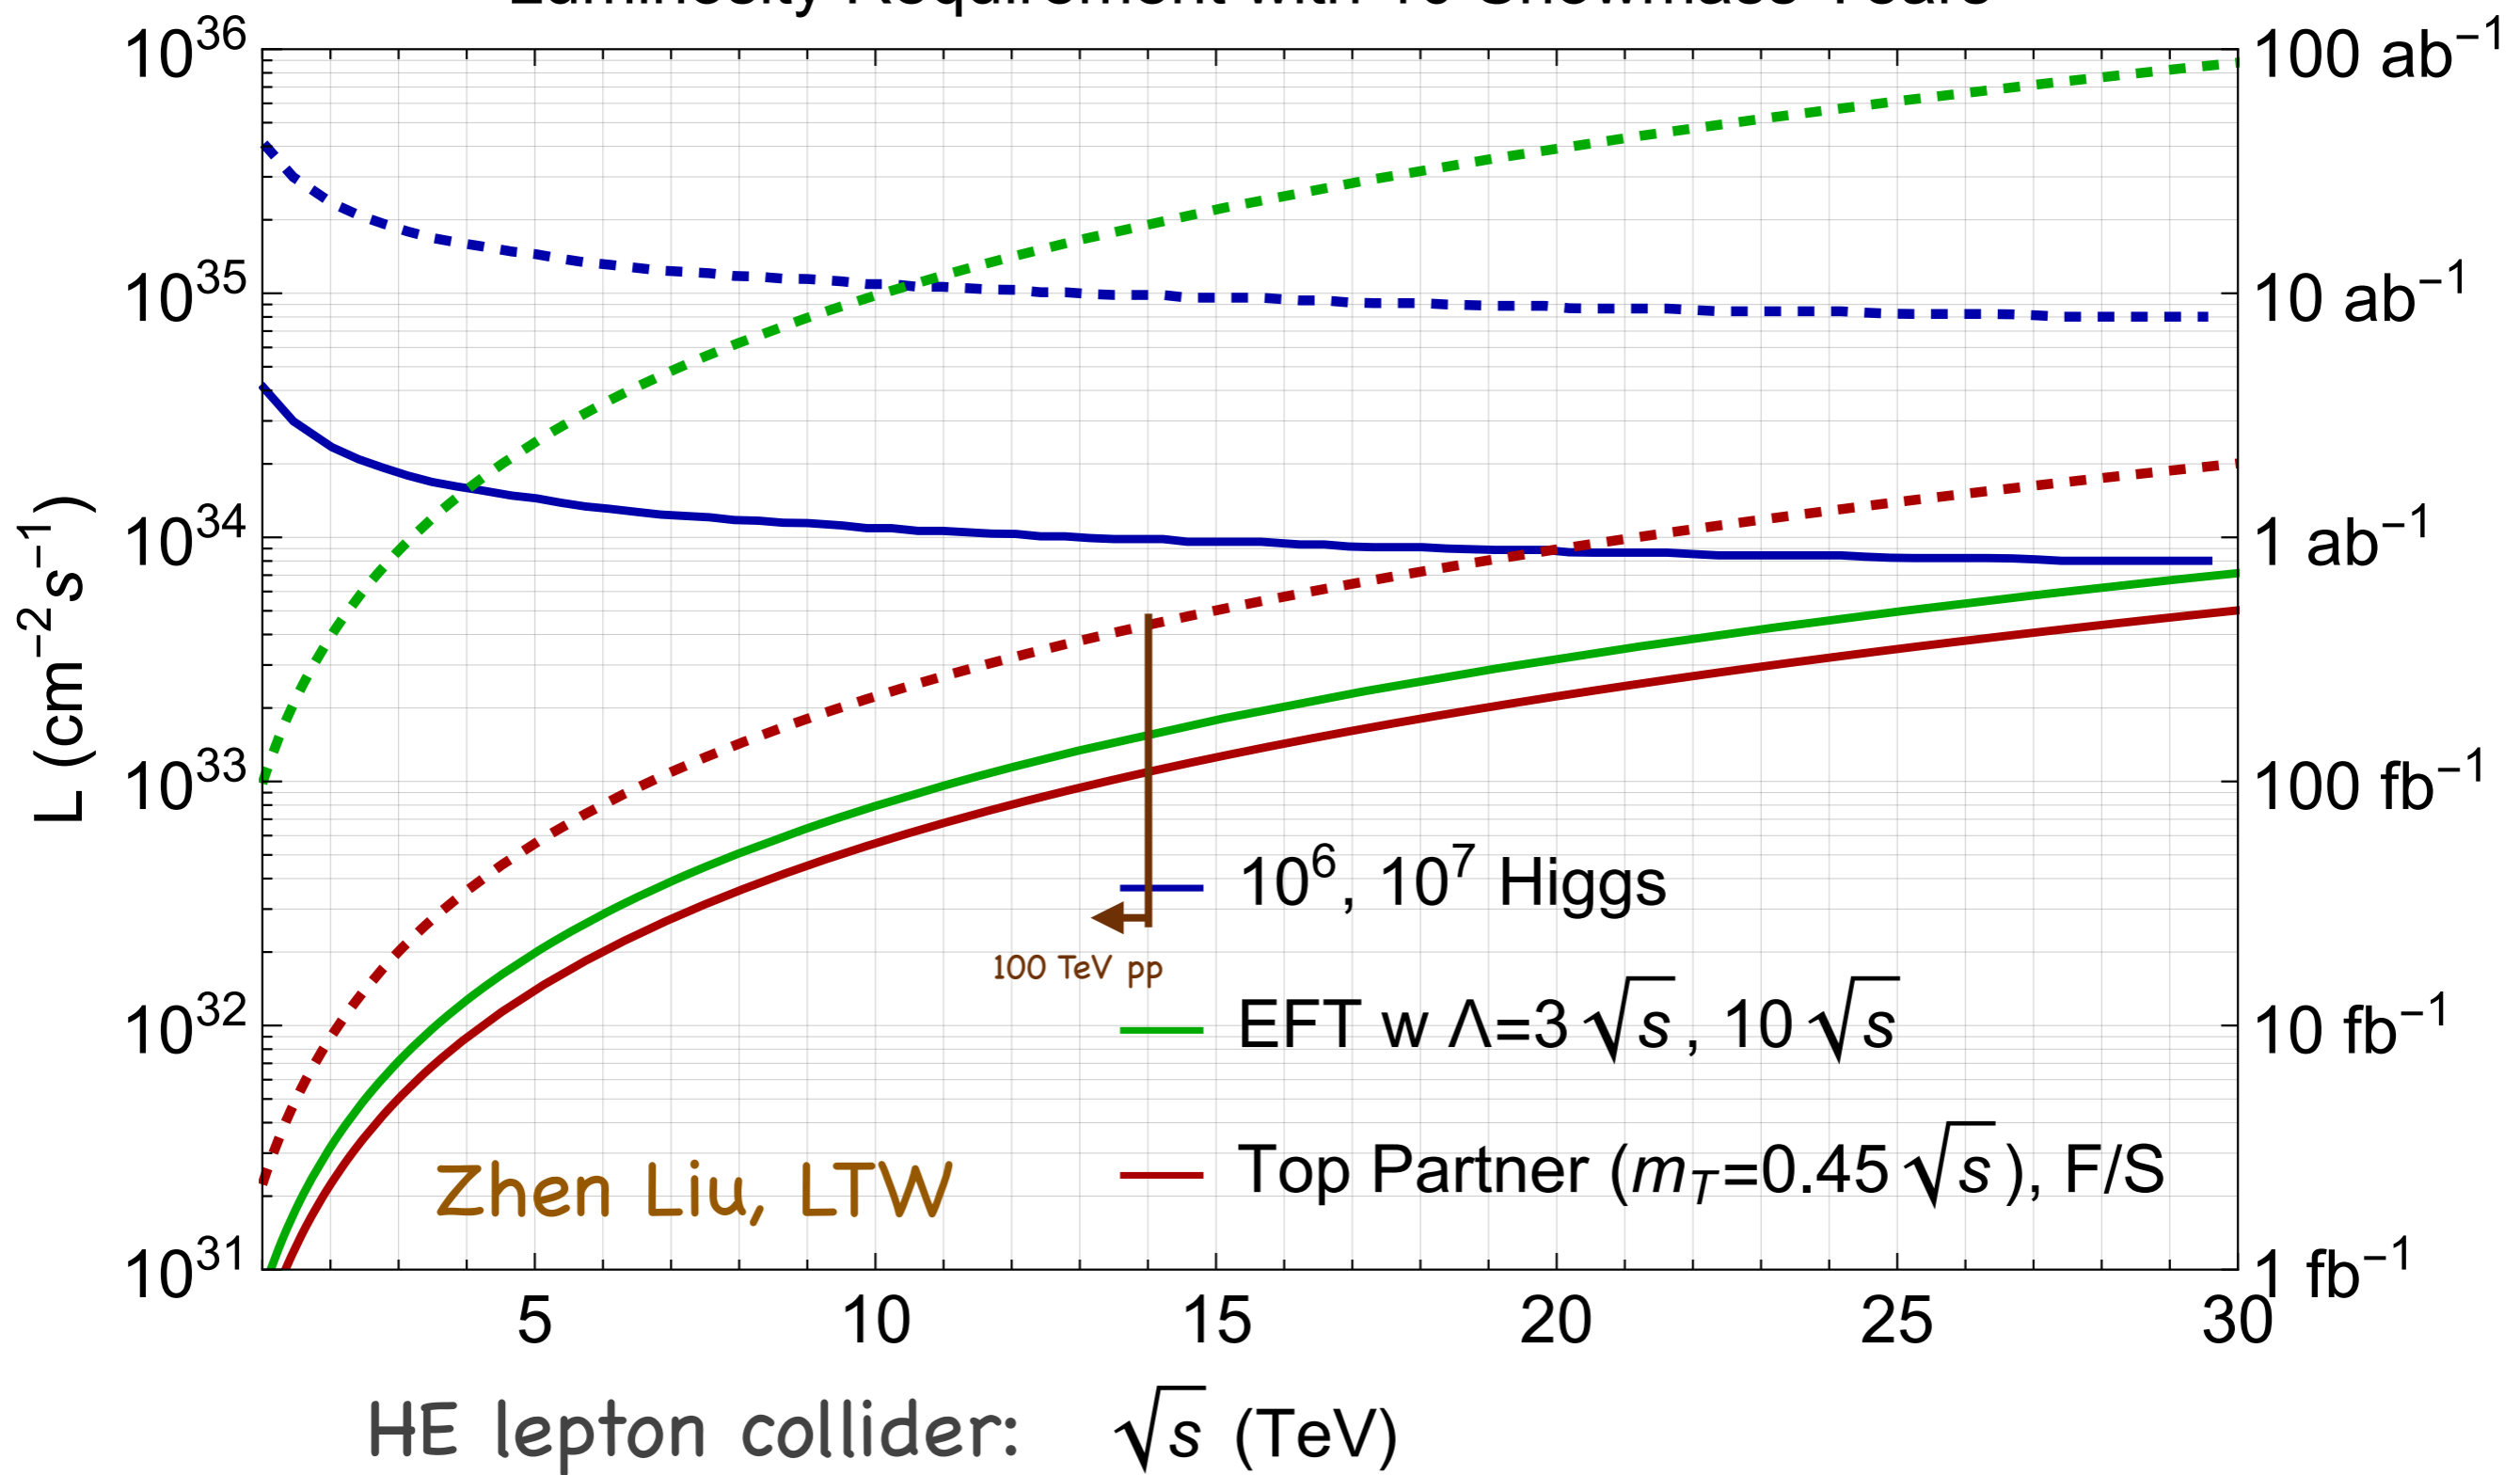

High energy muon collider

High energy muon collider can play a decisive role in probing WIMP dark matter!

Another example of th input: luminosity needs and physics goals

Luminosity Requirement with 10 Snowmass Years

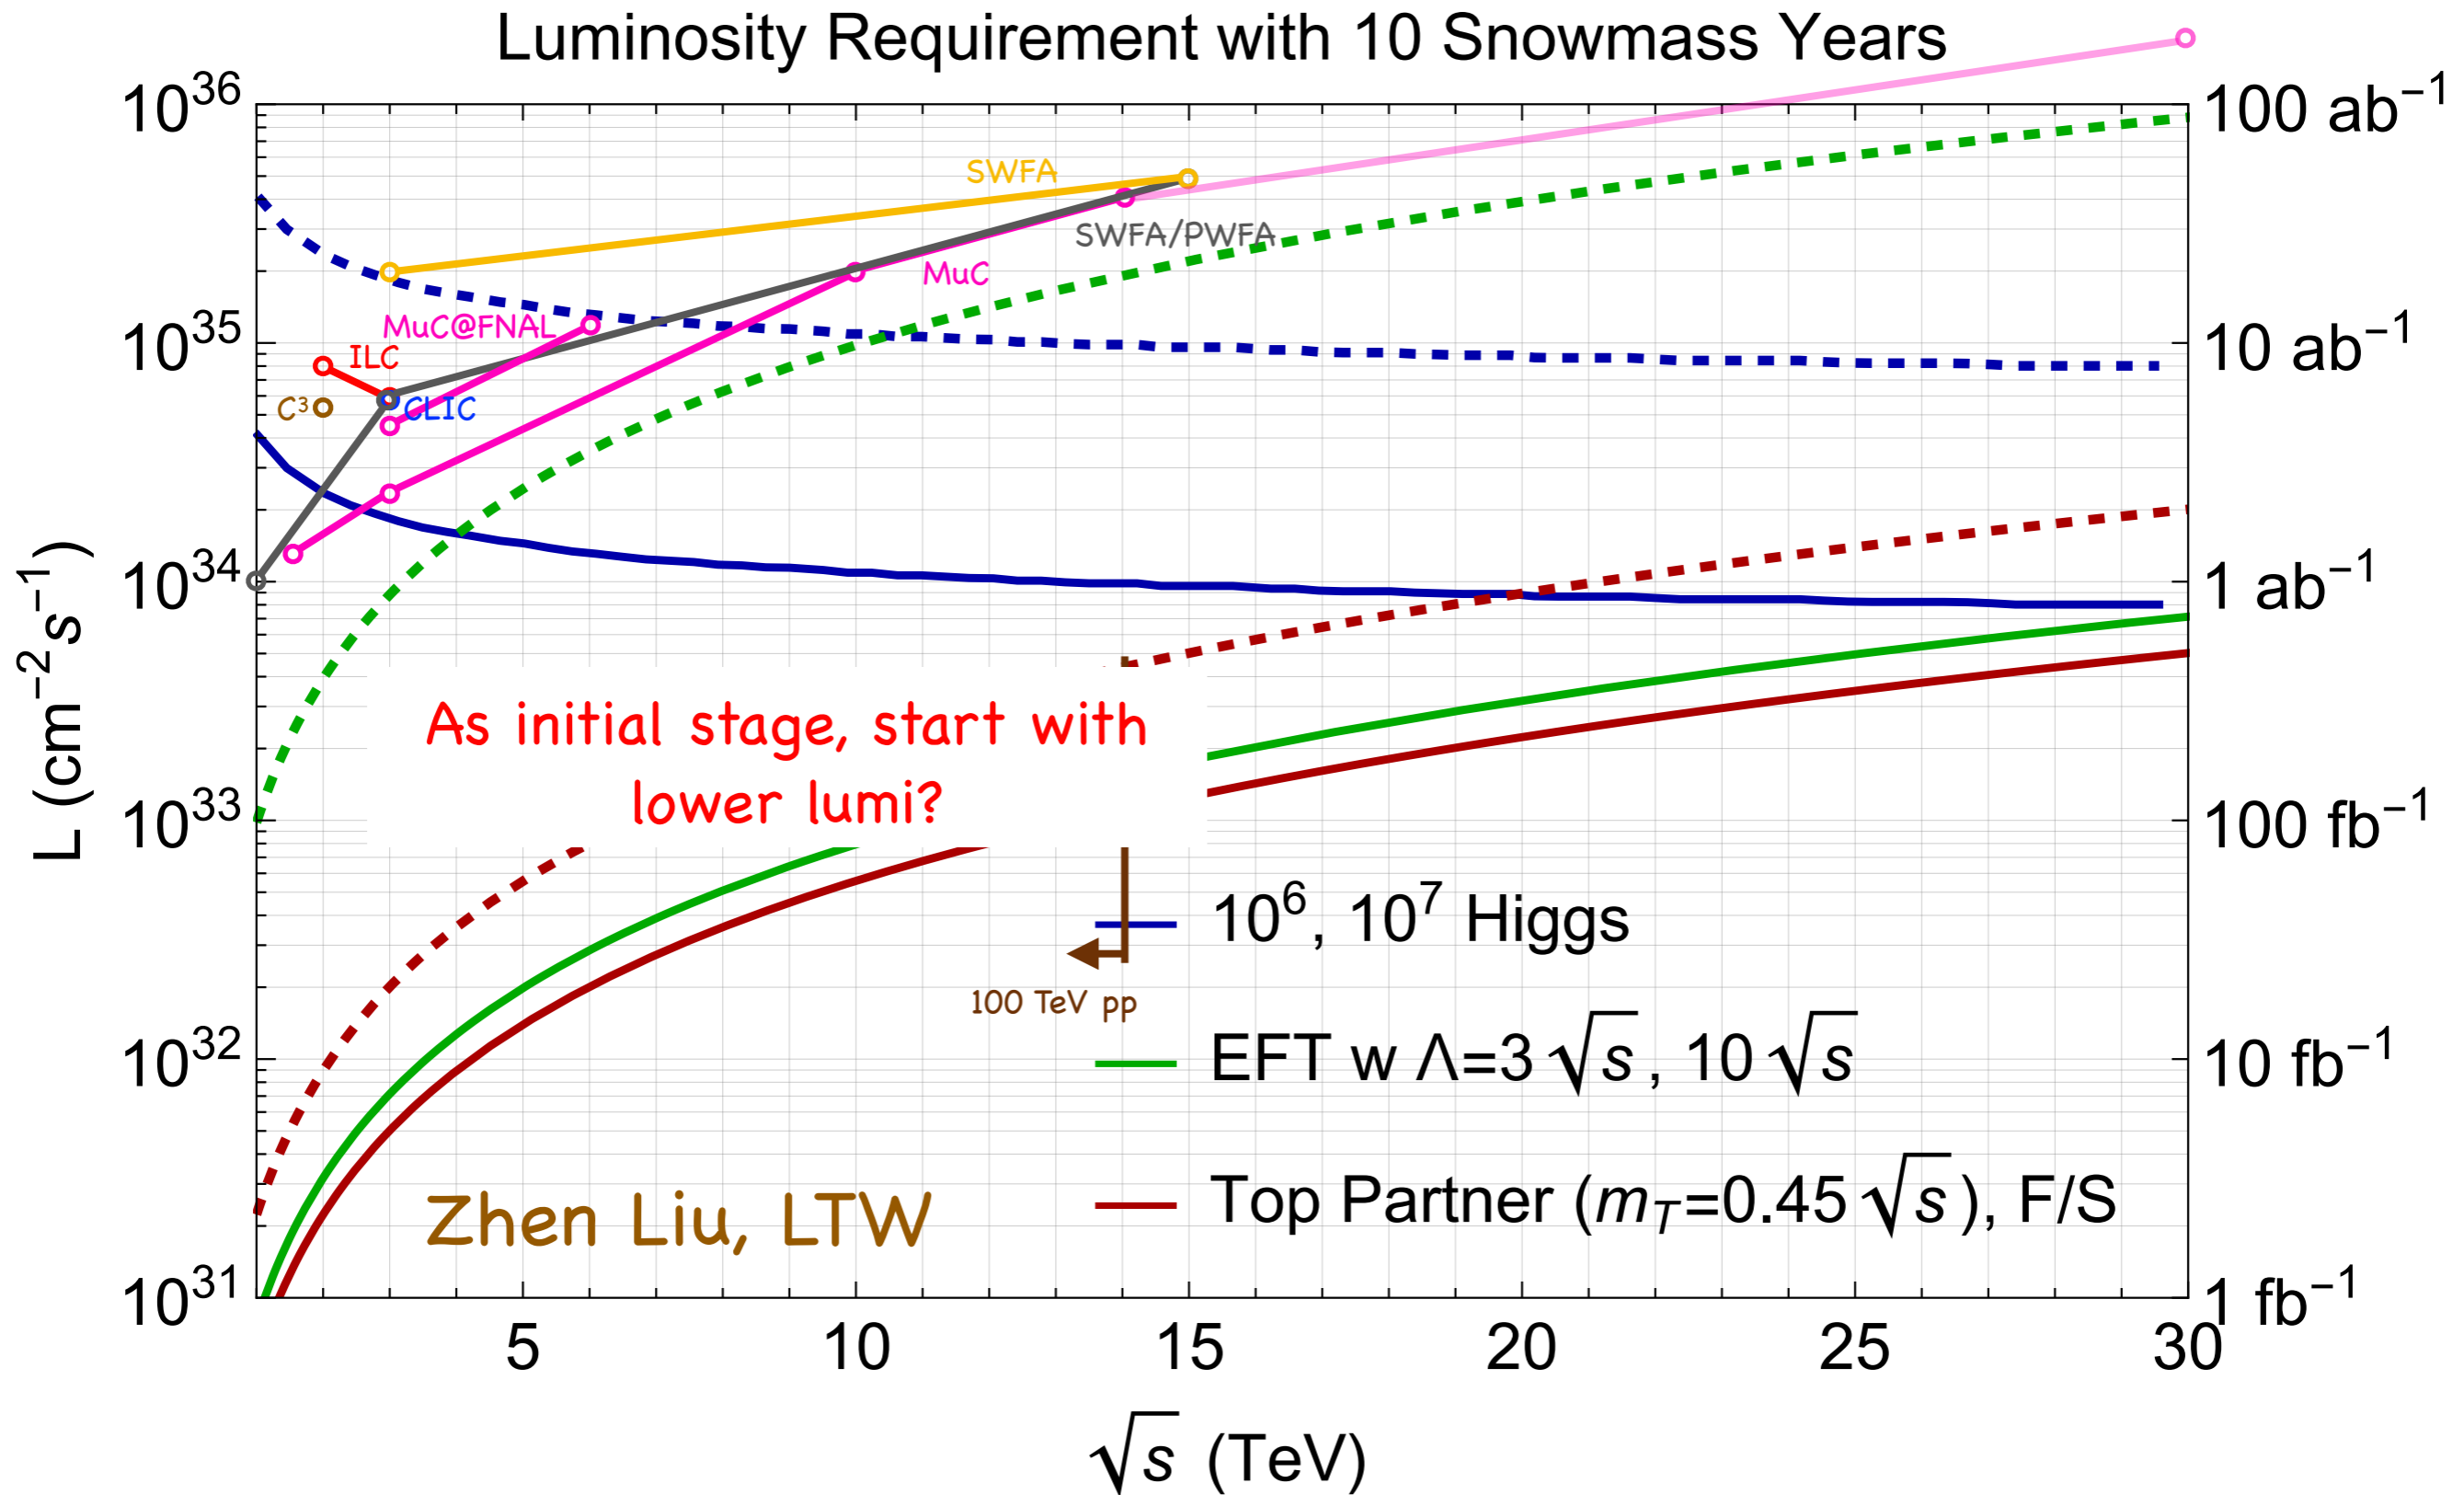

Another example of th input: luminosity needs and physics goals

wimp DM: about the muon collider line and $E_{\text{CM}} > 3$ TeV.

Another example of th input: luminosity needs and physics goals

wimp DM: about the muon collider line and $E_{\text{CM}} > 3$ TeV.

Not covered in this talk

Topical groups, Group Conveners, and Liasons

- **AF1: Beam Physics and Accelerator Education**
- **AF2: Accelerators for Neutrinos**
- **AF3: Accelerators for EW/Higgs**
- **AF4: Multi-TeV Colliders**
- **AF5: Accelerators for PBC and Rare Processes**
- **AF6: Advanced Accelerator Concepts**
- **AF7: Accelerator Technology R&D**
 - AF7-RF : RF Accelerator Technology R&D

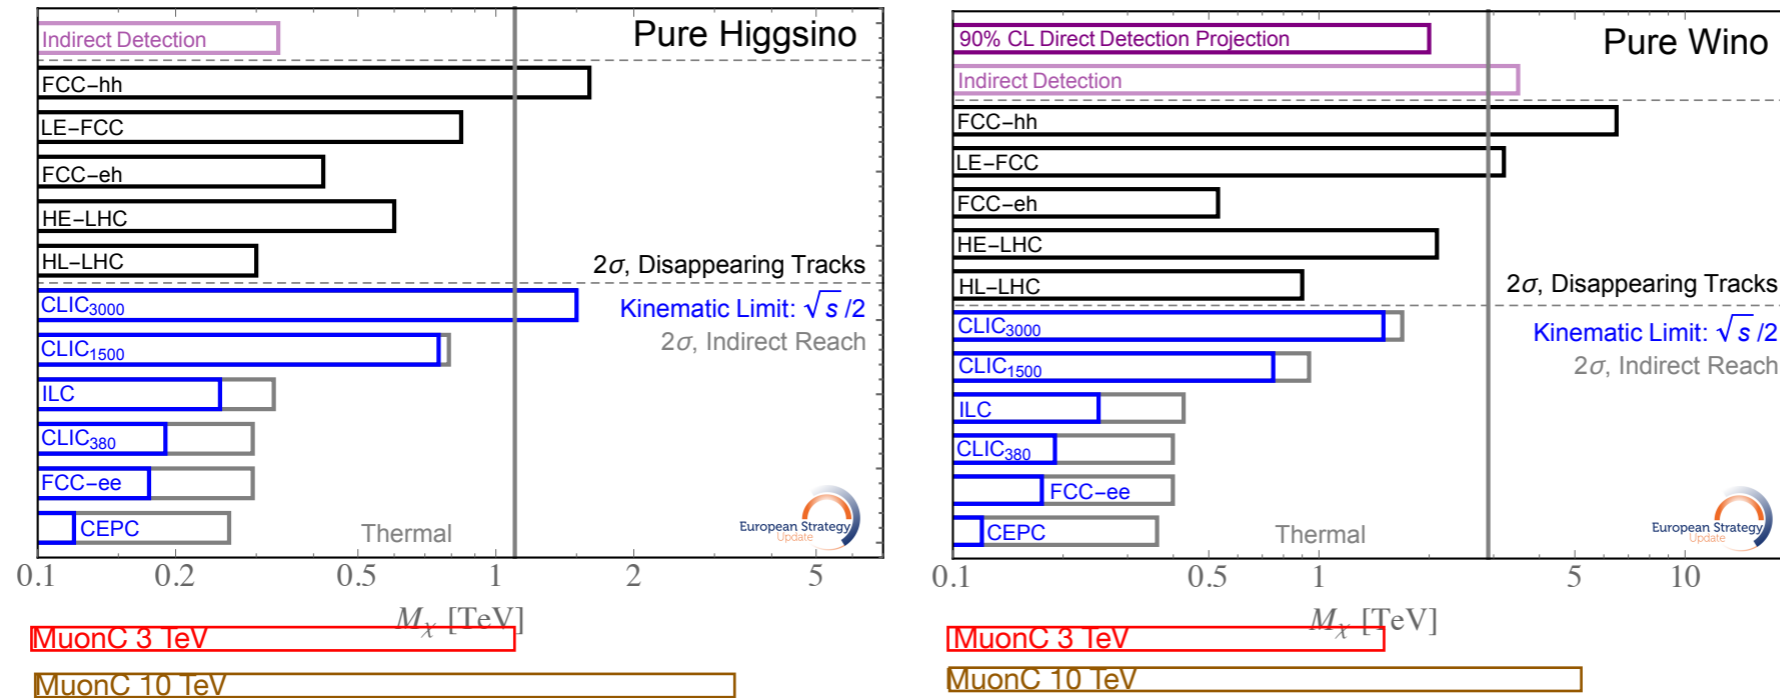

More details at [AF page](#)

Looking forward

- Theorists have been, and will continue to be, at the forefront of high energy physics.
 - ▶ Identifying questions.
 - ▶ Suggesting solutions.
 - ▶ Proposing ways of testing ideas.
- Laying the foundation of the planning for future accelerator facilities.
- With the future at stake, we need to think harder.
 - ▶ Anything big we have missed?

Extra

Dark matter reach

briefing book + my drawings for muon (or lepton) colliders.

Simplest WIMP model, very predictive, definitive target mass \approx TeVs.
Out of reach for LHC, difficult for direct detection.

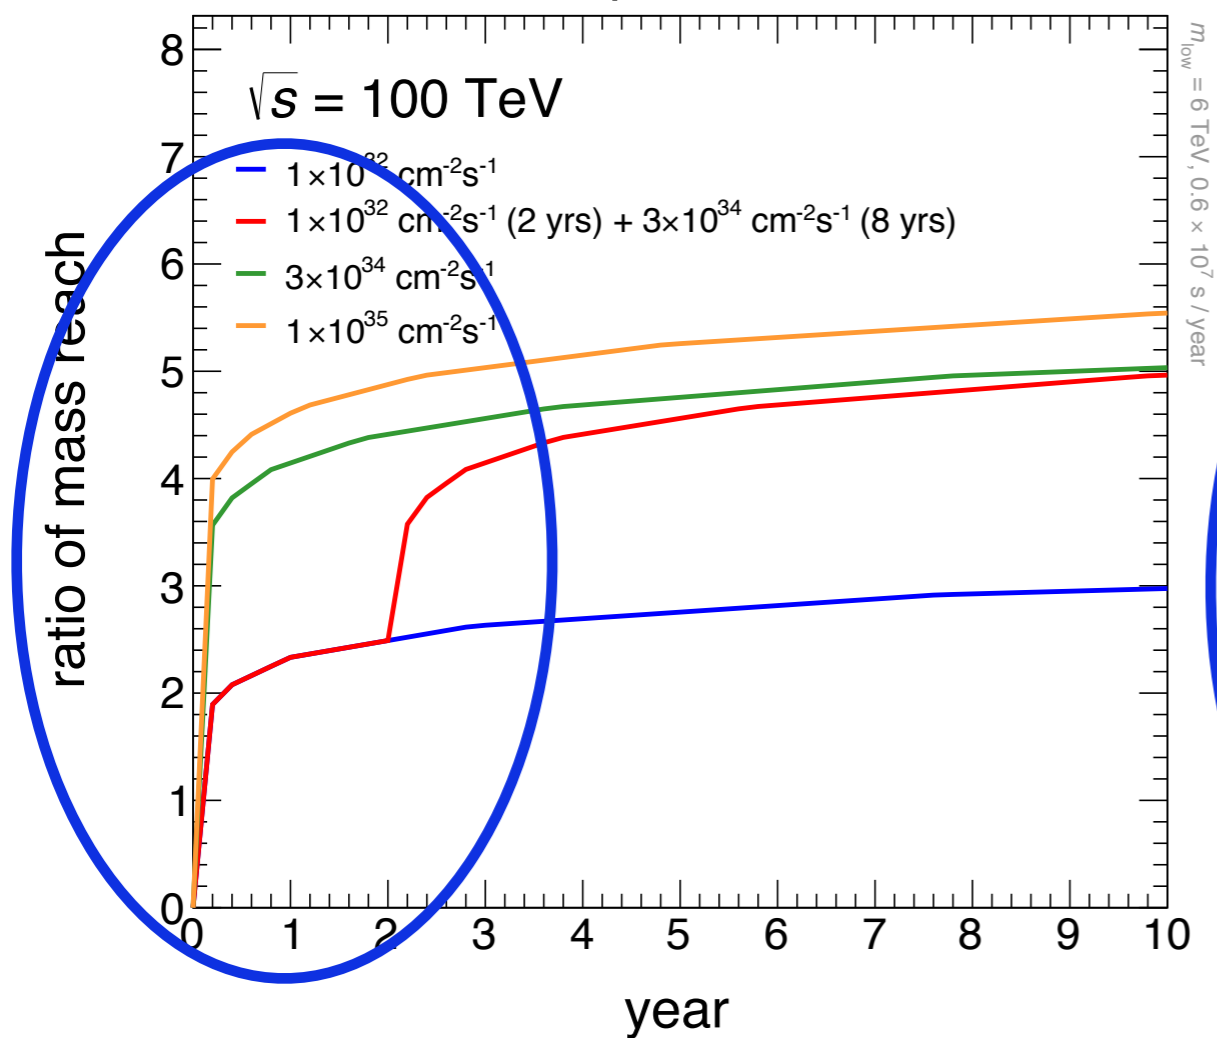

Lepton collider reach close to $0.5 \times E_{CM}$ (a little less), need 10(s) TeV and hi lumi
Hadron collider \approx a few percent $\times E_{CM}$, need 100 (or more) TeV

Hadron collider scenarios

Hadron collider scenarios

Mass Reach compared to HL-LHC 3 ab⁻¹

Rapid gain in mass reach

M. Low

Hadron collider scenarios

M. Low

Rapid gain in mass reach

$10^{34} \text{ cm}^{-2}\text{s}^{-1}$ doing a reasonable job for 100 TeV.
 Need higher luminosity for Higgs self-coupling.
 $10^{35}\text{--}10^{36} \text{ cm}^{-2}\text{s}^{-1}$ may be needed for higher energies.

Theorists → AF: physics goals vs luminosity (polarization...)

- Different physics goals need different machine parameters
 - ▶ For example: at high energy lepton colliders:
 - Discovery of heavy new physics particles and Higgs coupling measurements can require very different luminosities.

Clarifying further such trade-offs can be very beneficial
