

# A General Hybrid Radiation Transport Scheme for Star Formation Simulations on an AMR grid

**Mikhail Klassen**

*PhD Candidate, McMaster University*

Rolf Kuiper, Ralph Pudritz (Supervisor), Thomas Peters  
Robi Banerjee, Lars Bunttemeyer, Helen Kirk

KITP Santa Barbara, May 2014

# Context

- Star formation proceeds inside of turbulent, magnetized, and highly filamentary clouds (André et al. 2013)
- Radiation feedback is connected to a wide range of physical problems on a wide range of scales: from protoplanetary disks (Williams & Cieza 2011) to galaxies and the circumgalactic medium (e.g. Ceverino & Klypin 2009, Hopkins et al. 2013)

S106 Star-forming region containing IRS4.  
*NASA / ESA / Hubble Heritage Team (STScI/AURA)*

# Motivation

- We also want to study the impact of radiation feedback on these environments: **suppression of fragmentation**, creation of **outflows**, **radiation pressure**
- We are interested in correctly modelling the environments of star formation, including all of the effects of **supersonic turbulence** and **magnetic fields**

*Herschel/SPIRE 250 $\mu\text{m}$  dust map of the Polaris flare (Miville-Deschênes et al. 2010), processed by André et al (2010) to map the filaments*

# Characterizing filaments

- Apparent characteristic width of 0.1 pc (Arzoumanian et al. 2011)
- Velocity-coherent structures (Hacar et al. 2013)
- Stability (Ostriker 1964)
- Magnetic field alignment (Chapman et al. 2011)
- Clustered star formation at intersections (Schneider et al. 2012)
- Formation of HII regions (e.g. Dale & Bonnell 2011)

*Herschel* column density map of part of Aquila star-forming region by André et al (2010). Blue triangles show bound prestellar (Könyves et al. 2010)

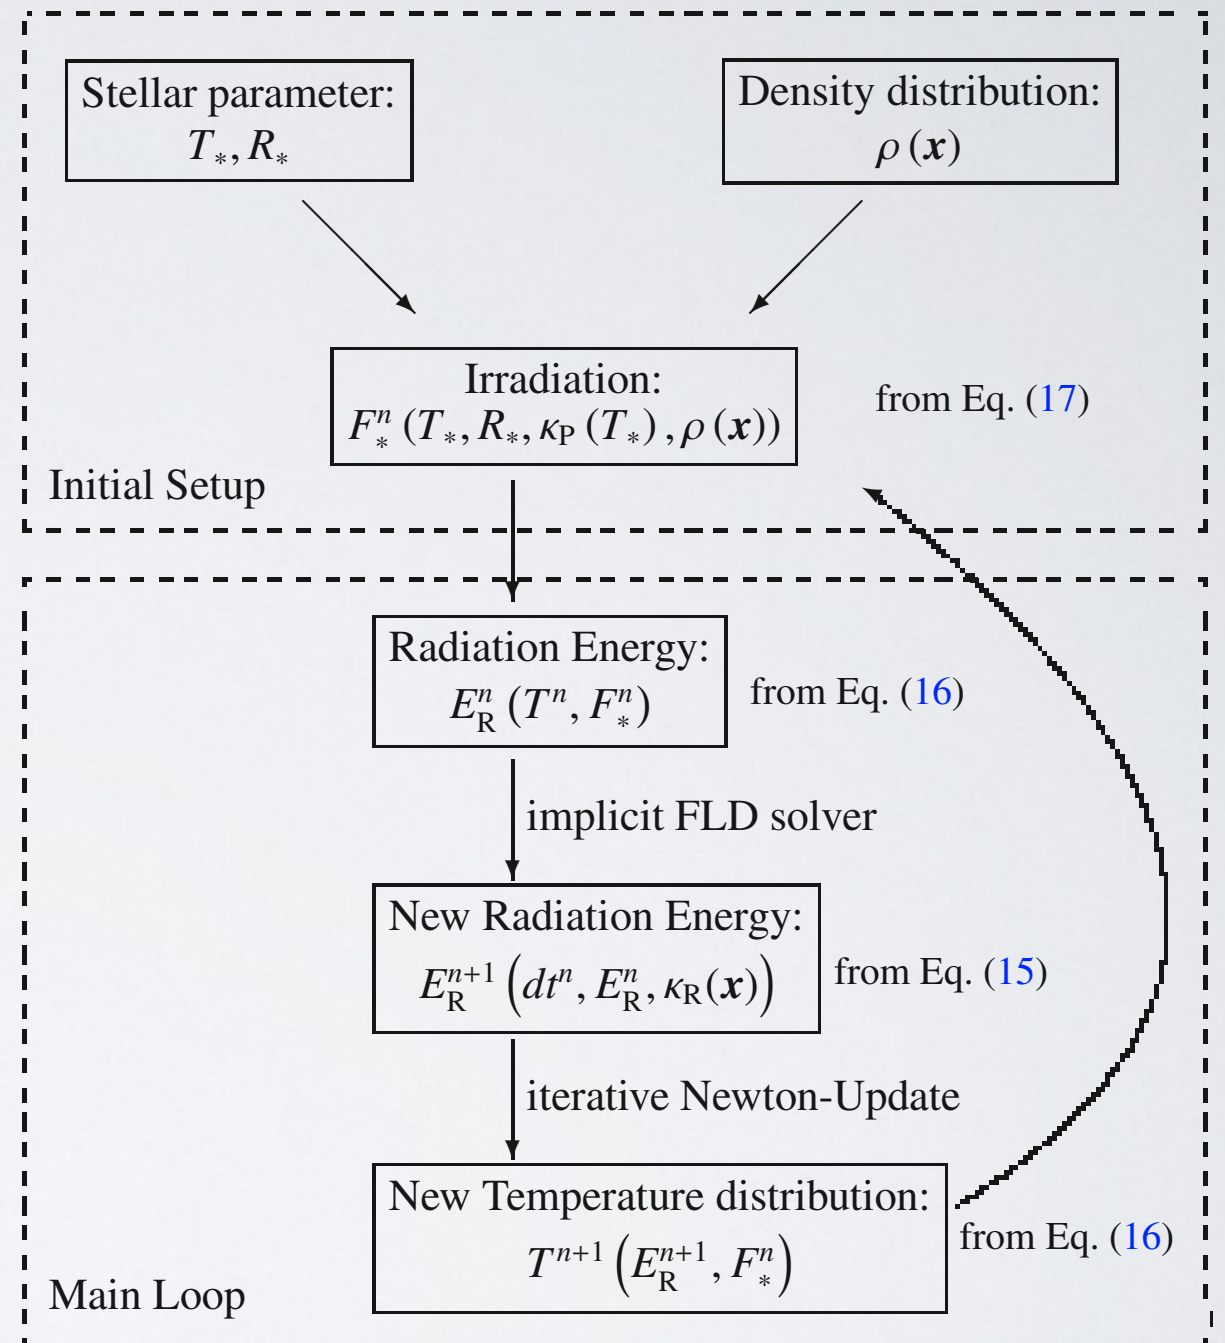

IC5146. *ESA / Herschel / PACS / Gould Belt Survey*

# Hybrid radiation transport

Kuiper & Klessen (2013)

Kuiper et al. (2010)

$$\frac{1}{c} \frac{\partial I}{\partial t} + \boldsymbol{\Omega} \cdot \boldsymbol{\nabla} I + \sigma I = \frac{c}{4\pi} (\sigma_a B + \sigma_s E),$$

$$E(\mathbf{r}, t) = \frac{1}{c} \int_{4\pi} d\boldsymbol{\Omega} I(\mathbf{r}, \boldsymbol{\Omega}, t).$$

$$\frac{\partial E}{\partial t} + \boldsymbol{\nabla} \cdot \mathbf{F} = c \sigma_a (B - E),$$

$$\frac{\partial E}{\partial t} + \nabla \cdot \mathbf{F} = c \sigma_a (B - E),$$

$$\mathbf{F}_{\text{rad}} = -D \nabla E_R,$$

$$D = \frac{\lambda c}{\kappa_R \rho}$$

c.f. Levermore & Pomraning (1981)

$$\begin{aligned}\partial_t \rho \epsilon &= -\kappa_P \rho c (a_R T^4 - E_R) + Q_{\text{sources}} \\ \partial_t E_R - \nabla \cdot F &= +\kappa_P \rho c (a_R T^4 - E_R)\end{aligned}$$

Radiation from stars typically added one of two ways:

$$E = \frac{L}{4\pi r^2 c},$$

e.g. Krumholz et al. (2007)

$$\sum_i L_i W(\mathbf{x} - \mathbf{x}_i),$$

e.g. A. Myers et al. (2011)

$$\begin{aligned}\partial_t \rho \epsilon &= -\kappa_P \rho c (a_R T^4 - E_R) + Q_{\text{sources}} \\ \partial_t E_R - \nabla \cdot F &= +\kappa_P \rho c (a_R T^4 - E_R)\end{aligned}$$

Alternatively, we use a raytracer to compute the source term and its coupling to the matter internal energy

$$\begin{aligned}Q_{\text{sources}} &= -\nabla \cdot F_* \\ F_*(r) &= \sigma T_*^4 \left( \frac{R_*}{r} \right)^2 \exp(-\tau)\end{aligned}$$

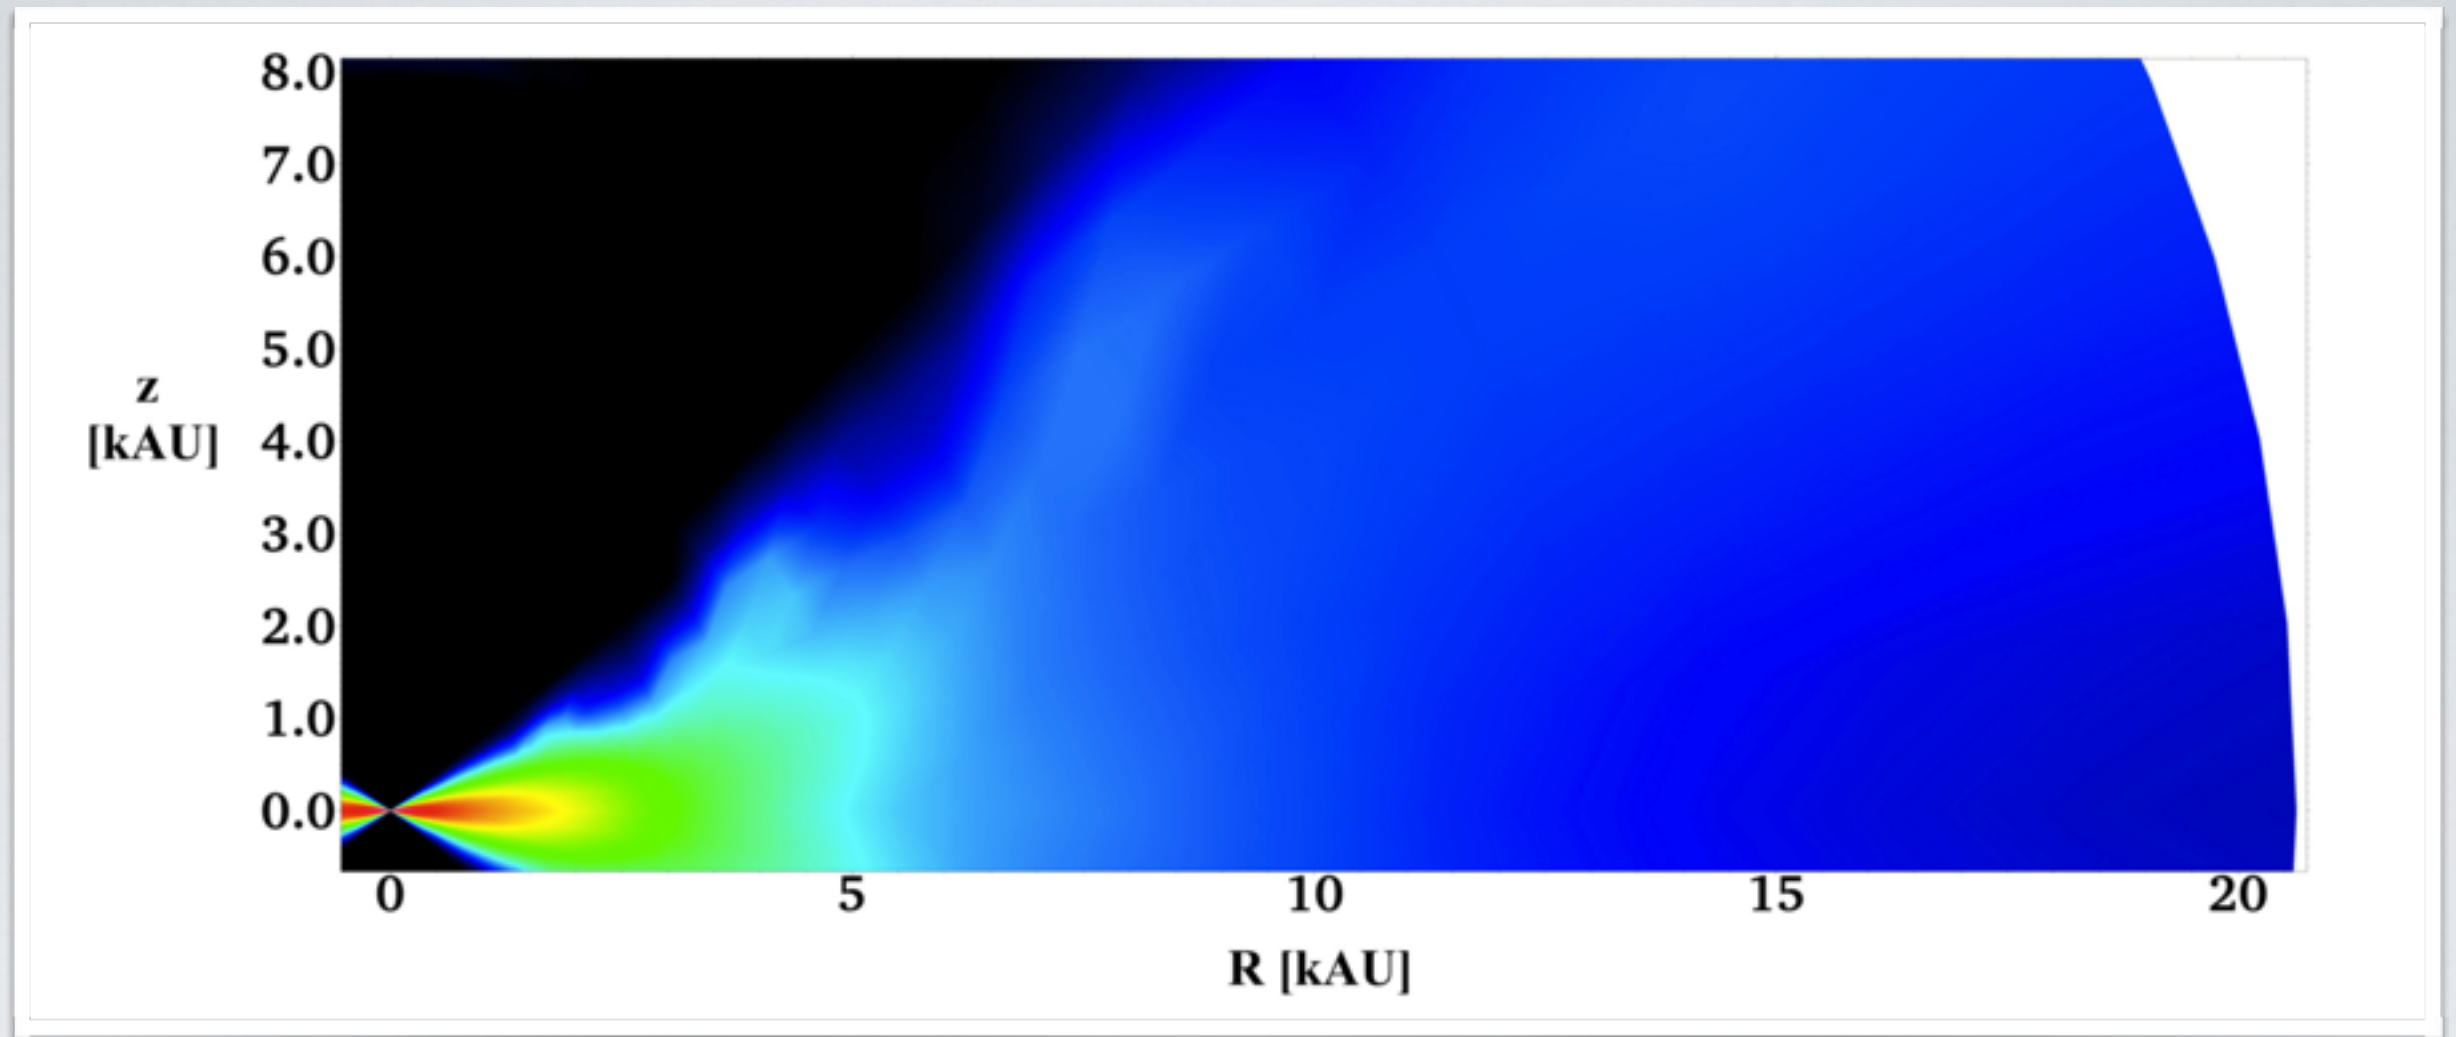

“Hybrid-Characteristics” raytracing  
(Rijkhorst et al. 2006)

$$\nabla \cdot F_*(r) \approx -\frac{(1 - e^{\tau_{\text{local}}})}{\Delta x} F_*(r),$$

We compute the specific “irradiation”  
for each cell in the simulation grid.

- Update the energies/temperatures including new source terms and continue the evolution.
- 2T method on a Cartesian AMR grid that can handle multiple sources: i.e. clustered star formation on GMC scale

Testing the method

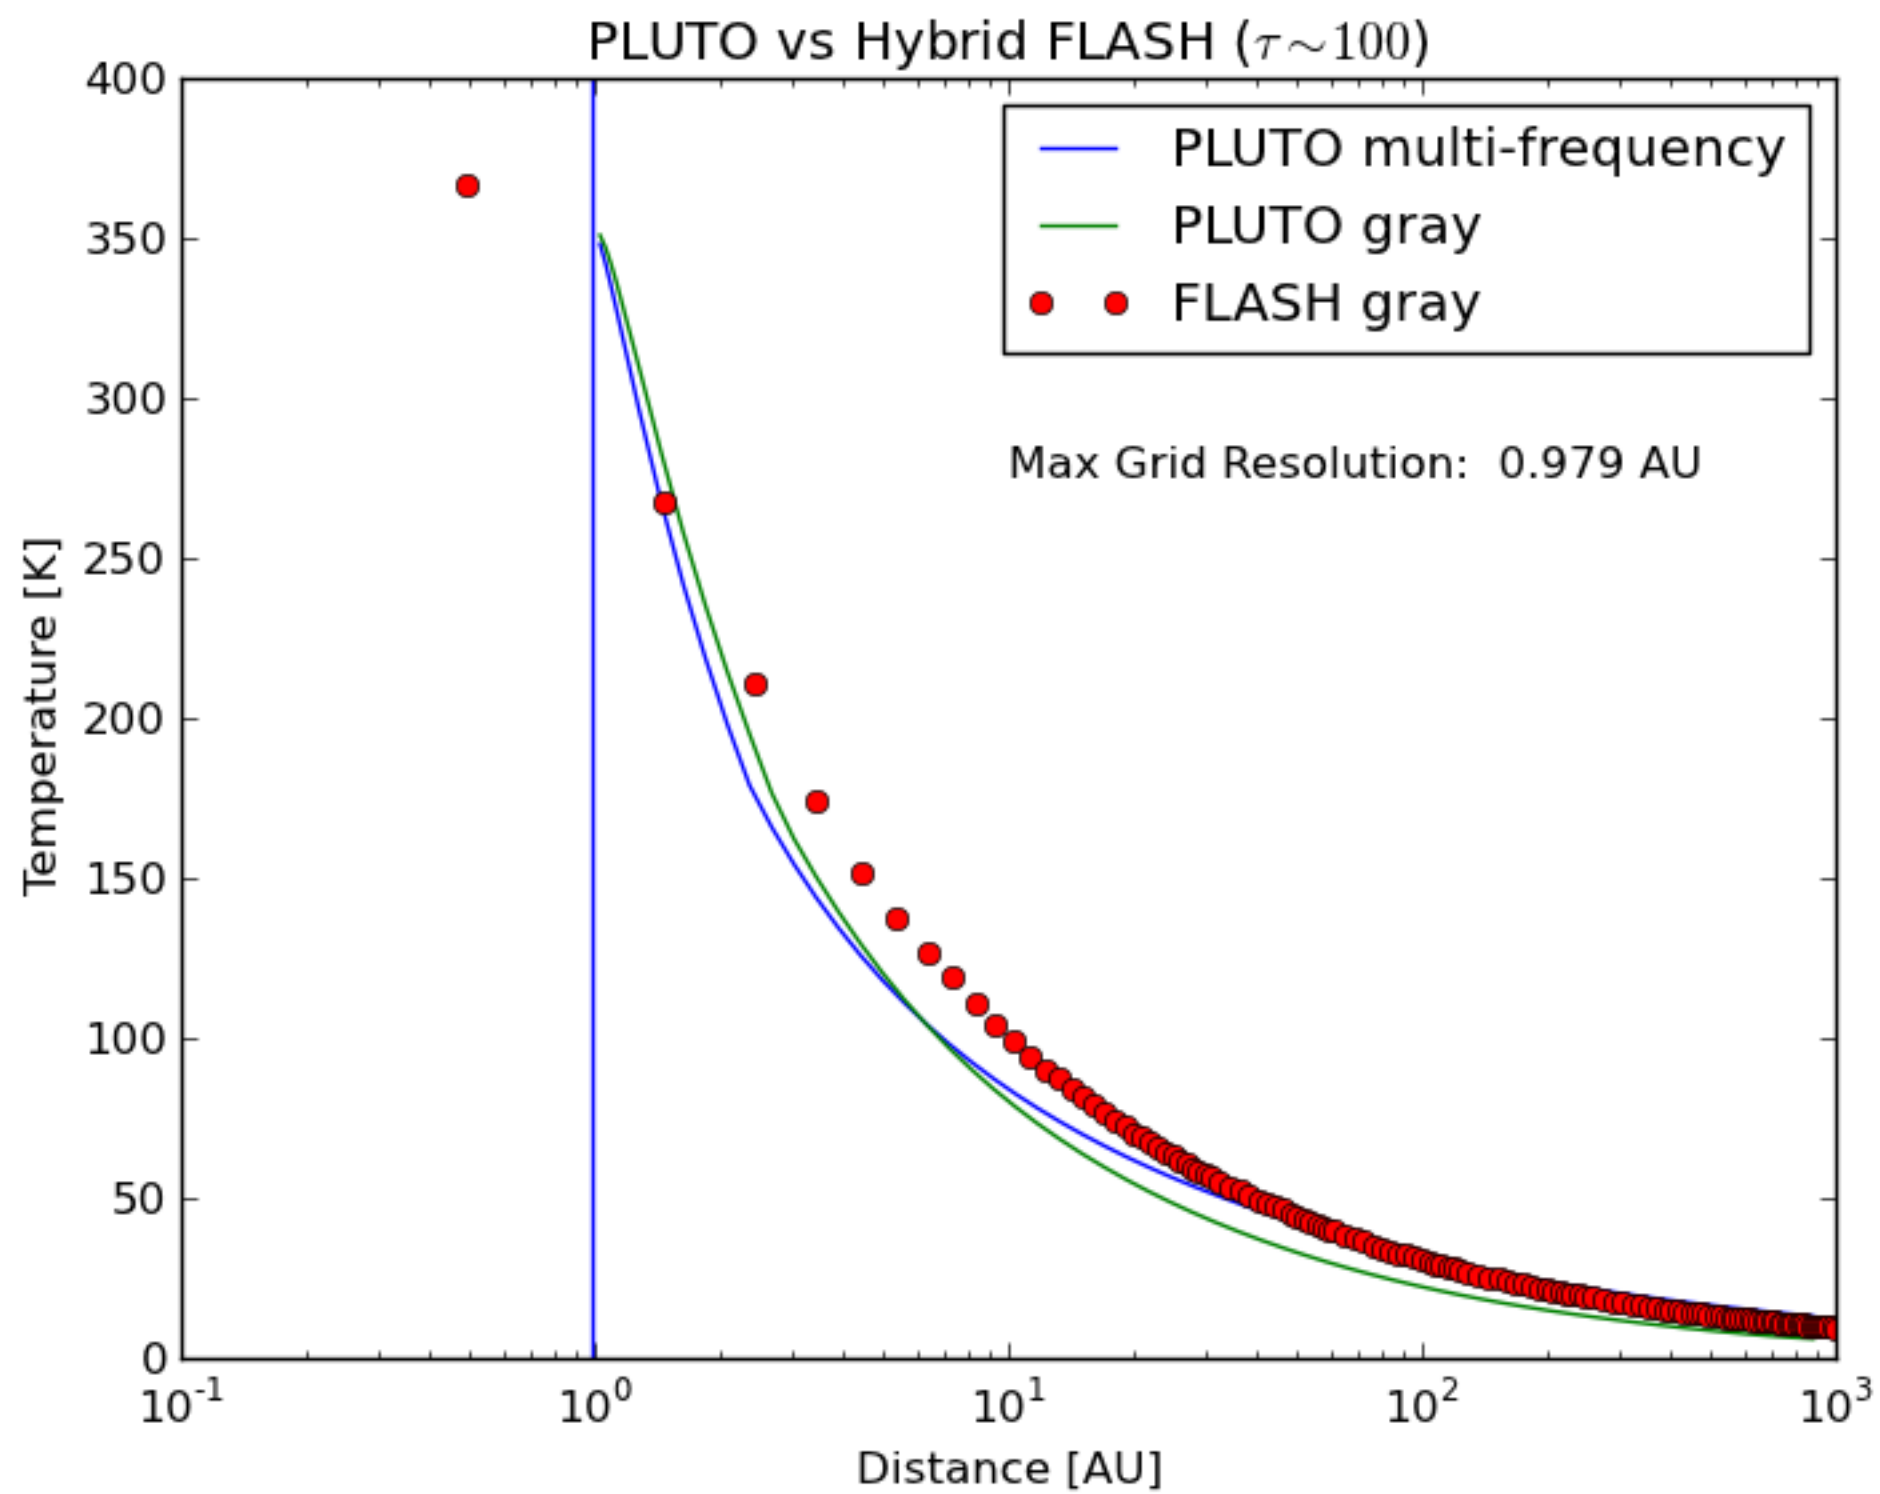

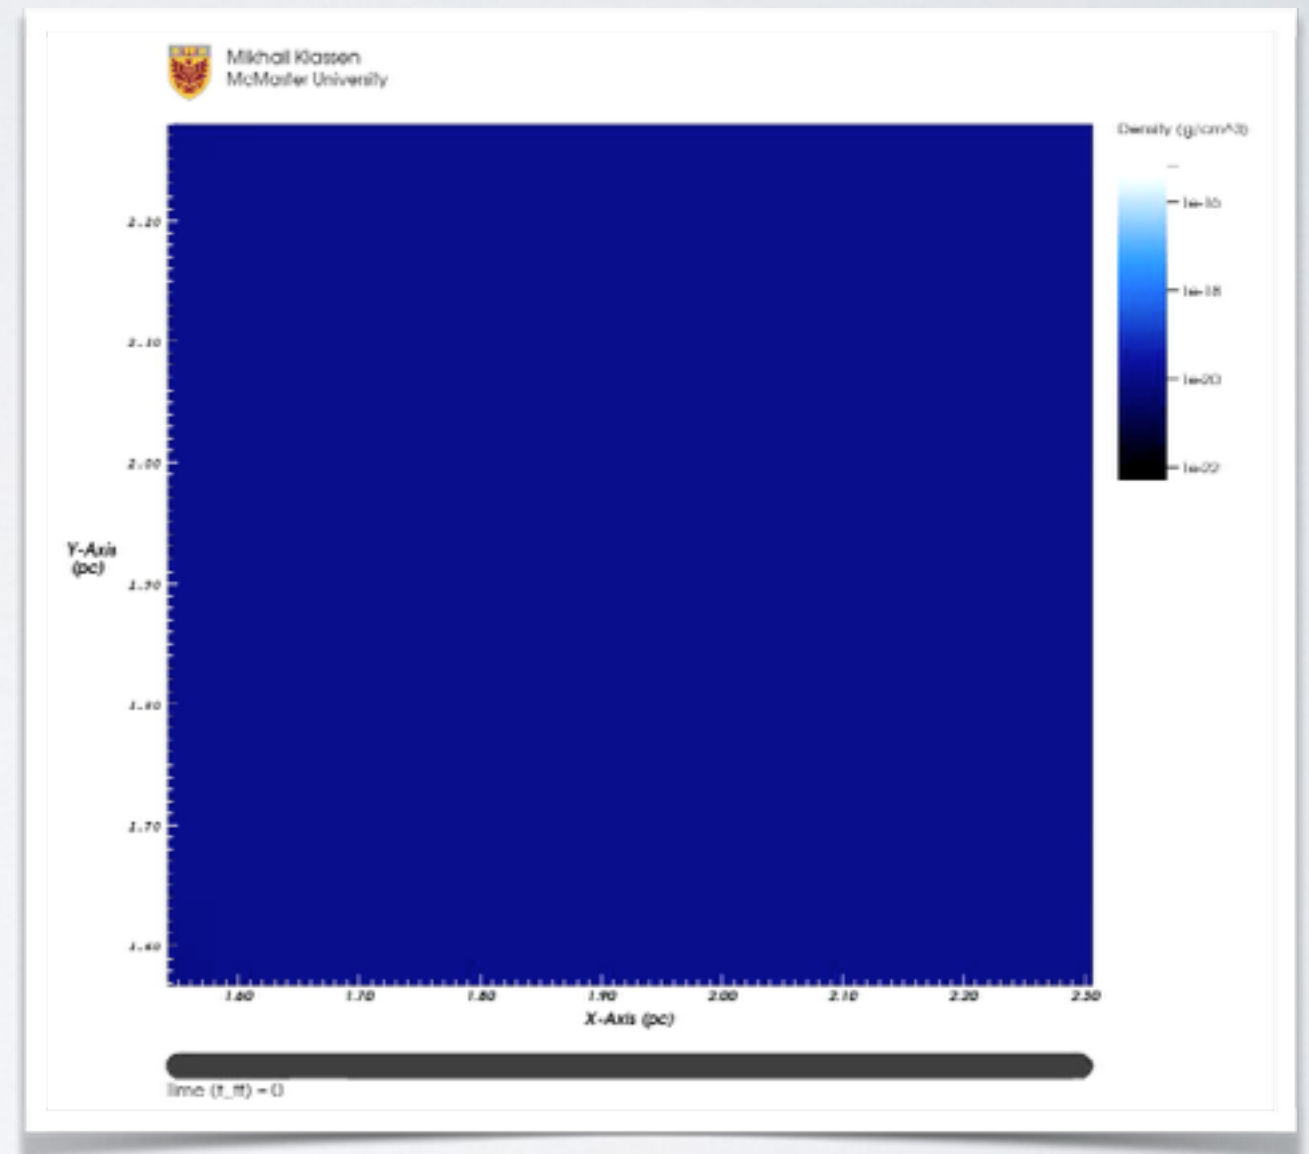

Under development

# Currently in testing/development

- Radiation feedback from evolving sink particles, using protostellar evolution subgrid model, in a turbulent, magnetized medium (Klassen et al. 2012a,b)
- Updating FLASH4 with ionizing radiation (Peters et al. 2010)
- Multifrequency RT

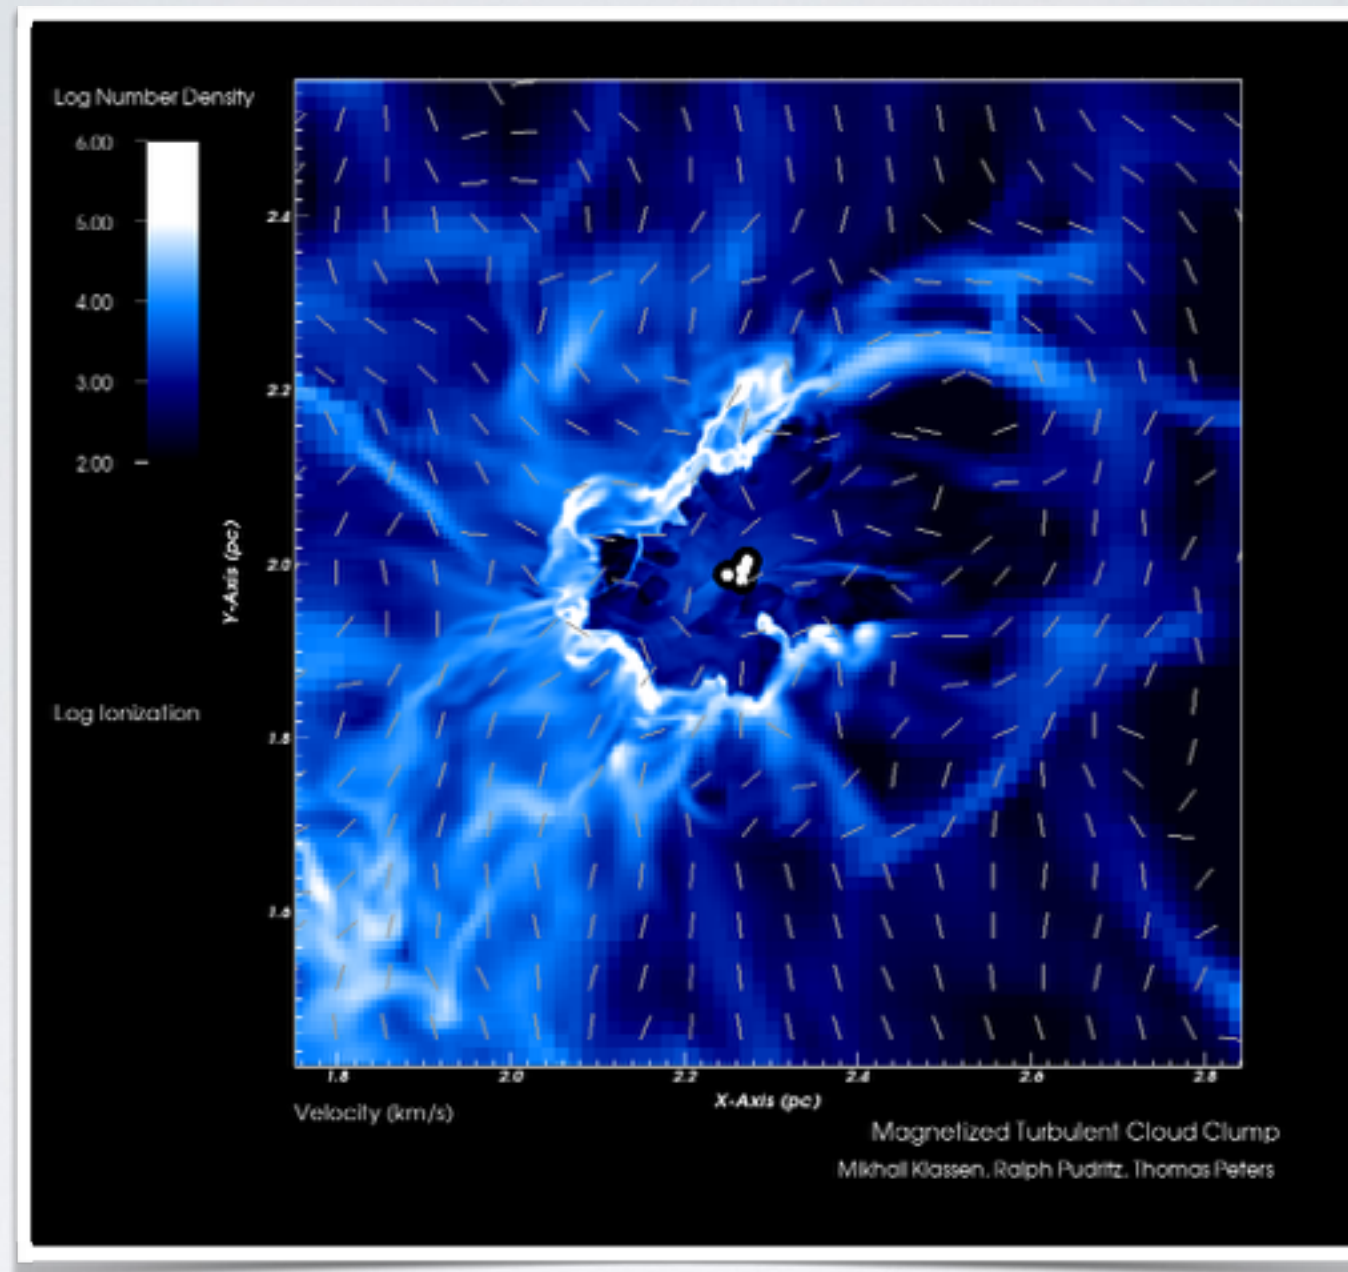

# Science goals

- Simulate clustered star formation in the turbulent, magnetized, filamentary interstellar medium
- Study massive stars and their outflows
- Resolve the structure of protoplanetary disks and measure their properties

Studying filaments

# Summary

- Study of the ISM linked to star formation feedback — a challenging problem requiring detailed numerical simulation
- We are implementing a 2T hybrid radiation transport method in FLASH on AMR grids
  - Ionizing feedback and multifrequency treatment to come
- This method is ideally suited for studying star formation in the turbulent, magnetized, filamentary ISM and down to protoplanetary disk scales

Thank you
