$N = 10^{10}$ viruses

Recombination in viruses – Influenza

- 11 genes on 8 segments
- 16 H (hemagglutinin) subtypes
- 9 N (neuraminidase) subtypes
- H1N1, H2N2, H3N2, H5N1 are common

Recombination in viruses – Influenza

- 11 genes on 8 segments
- 16 H (hemagglutinin) subtypes
- 9 N (neuraminidase) subtypes
- H1N1, H2N2, H3N2, H5N1 are common

- Pandemics often follow reassortments, e.g. pandemics 1957 (H2N2) and 1968 (H3N2)
- Reassortment is frequent in waterfowl and swine, where many subtypes circulate.

Why do viruses have sex?

MAX-PLANCK-GESELLSCHAFT

Why do viruses have sex?

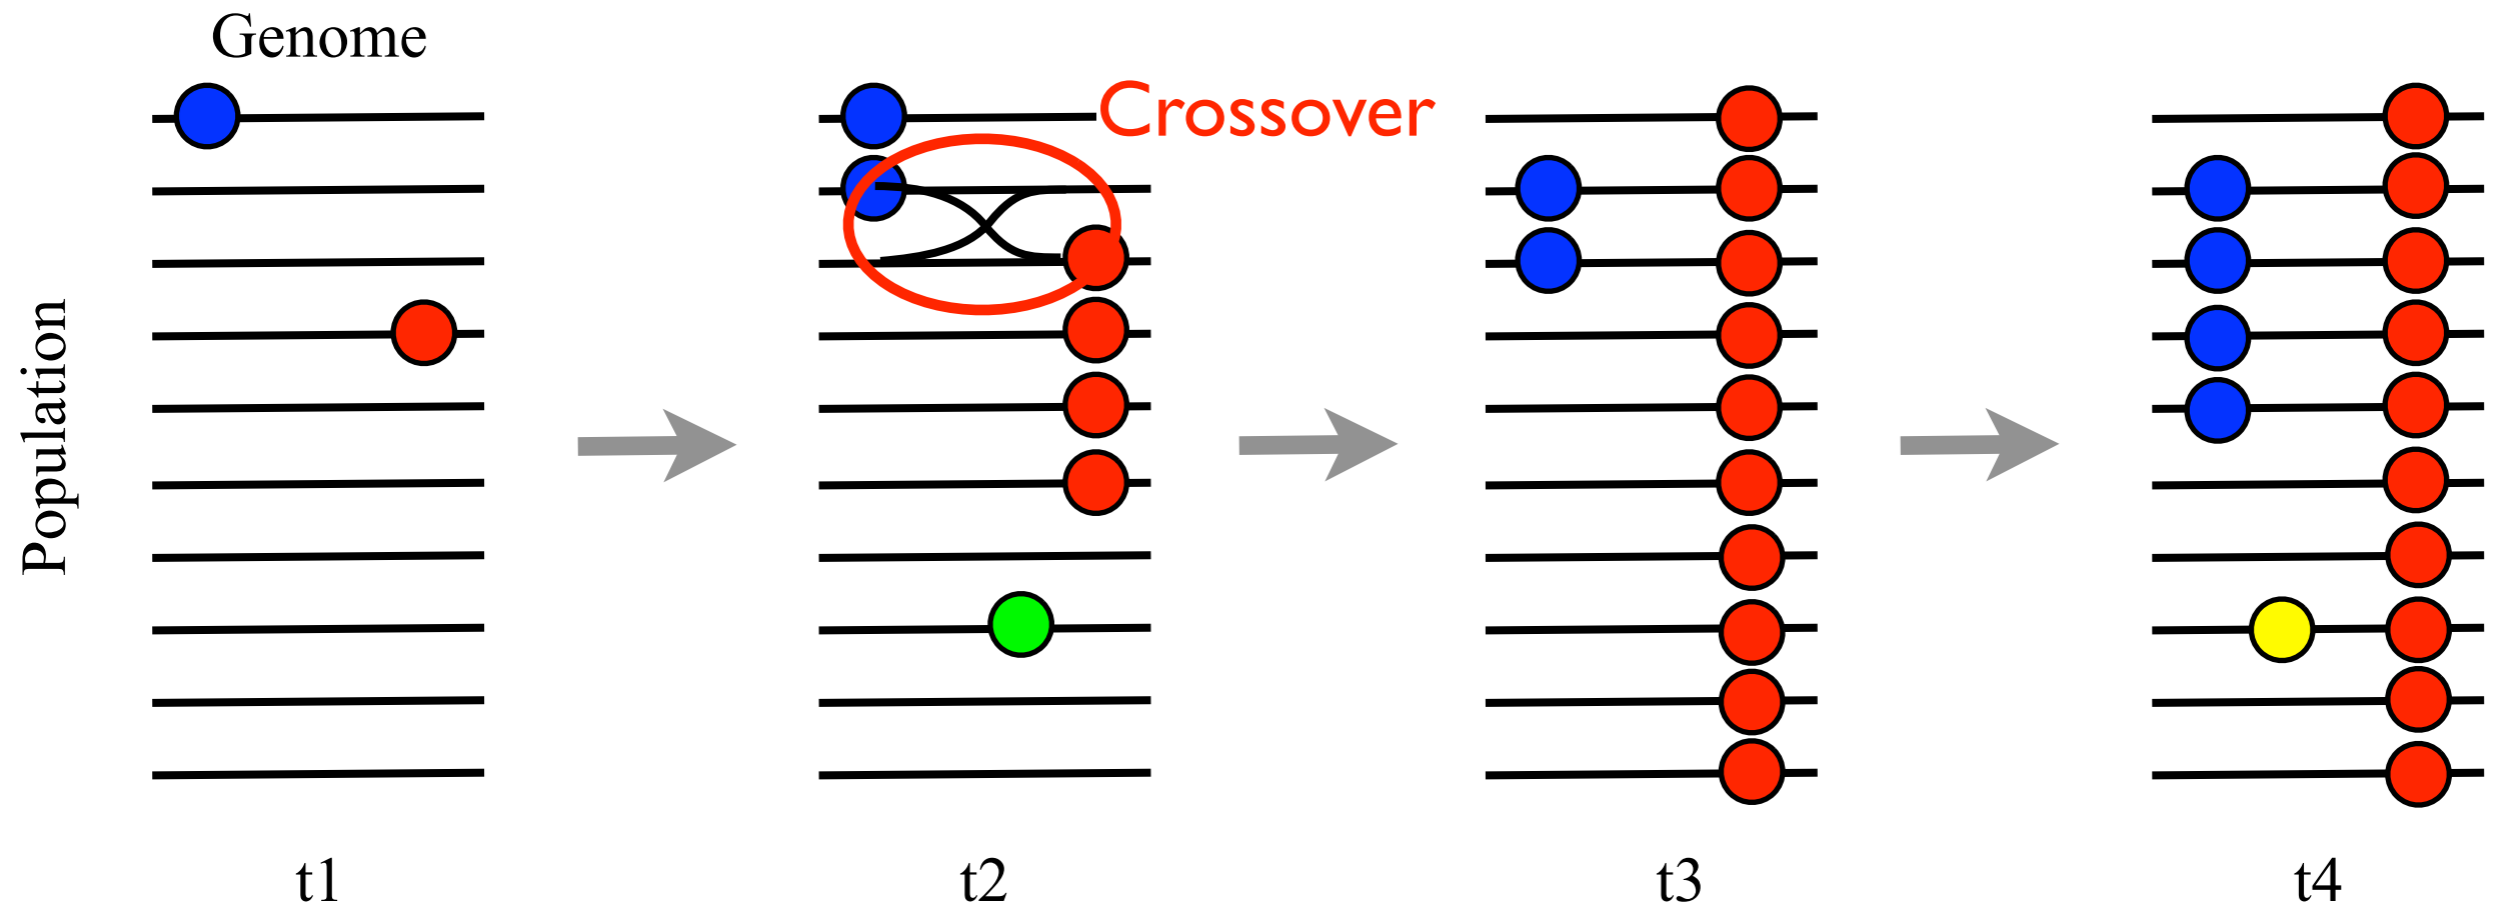

MAX-PLANCK-GESELLSCHAFT

Why do viruses have sex?

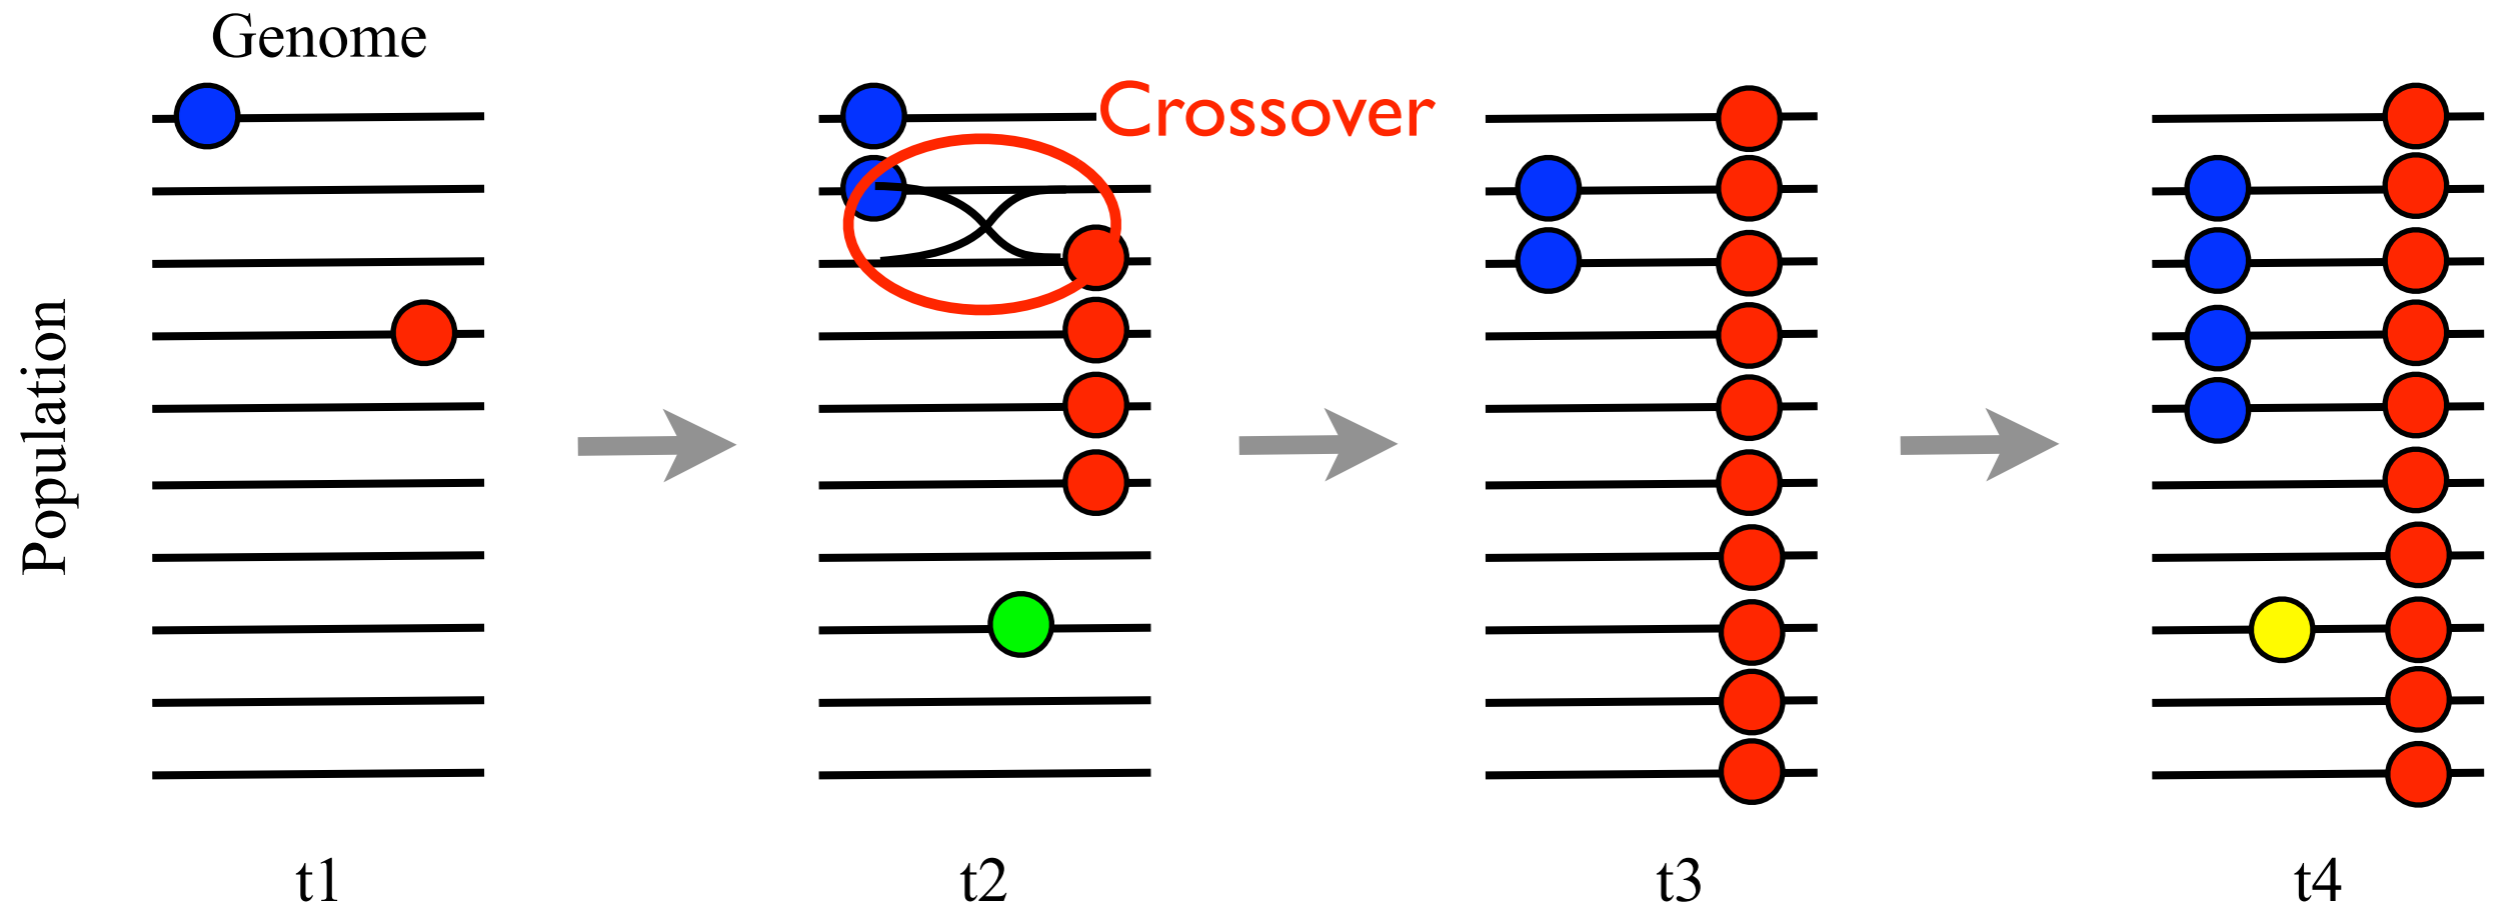

MAX-PLANCK-GESELLSCHAFT

Why do viruses have sex?

- Recombination allows innovation in parallel
- Different innovations can be combined once they are frequent
- Beneficial mutations can be separated from deleterious ones

Why do viruses have sex?

- Recombination allows innovation in parallel
- Different innovations can be combined once they are frequent
- Beneficial mutations can be separated from deleterious ones

Can we quantify this effect?

Evolution in asexual and sexual organisms

Small Population

Sequential innovations:
rate $\sim N$

Evolution in asexual and sexual organisms

Small Population

Sequential innovations:
rate $\sim N$

Large Population

Many concurrent mutations:
rate $\sim \log N$

Most good mutations are wasted!

Evolution in asexual and sexual organisms

Small Population

Sequential innovations:
rate $\sim N$

Large Population

Many concurrent mutations:
rate $\sim \log N$

Most good mutations are wasted!

Conventional wisdom:
rate $\sim N$

RA Fisher (1930), H Muller (1932),
M Kimura and J Crow (1965)

Quantifying the benefits of recombination [for the virus]

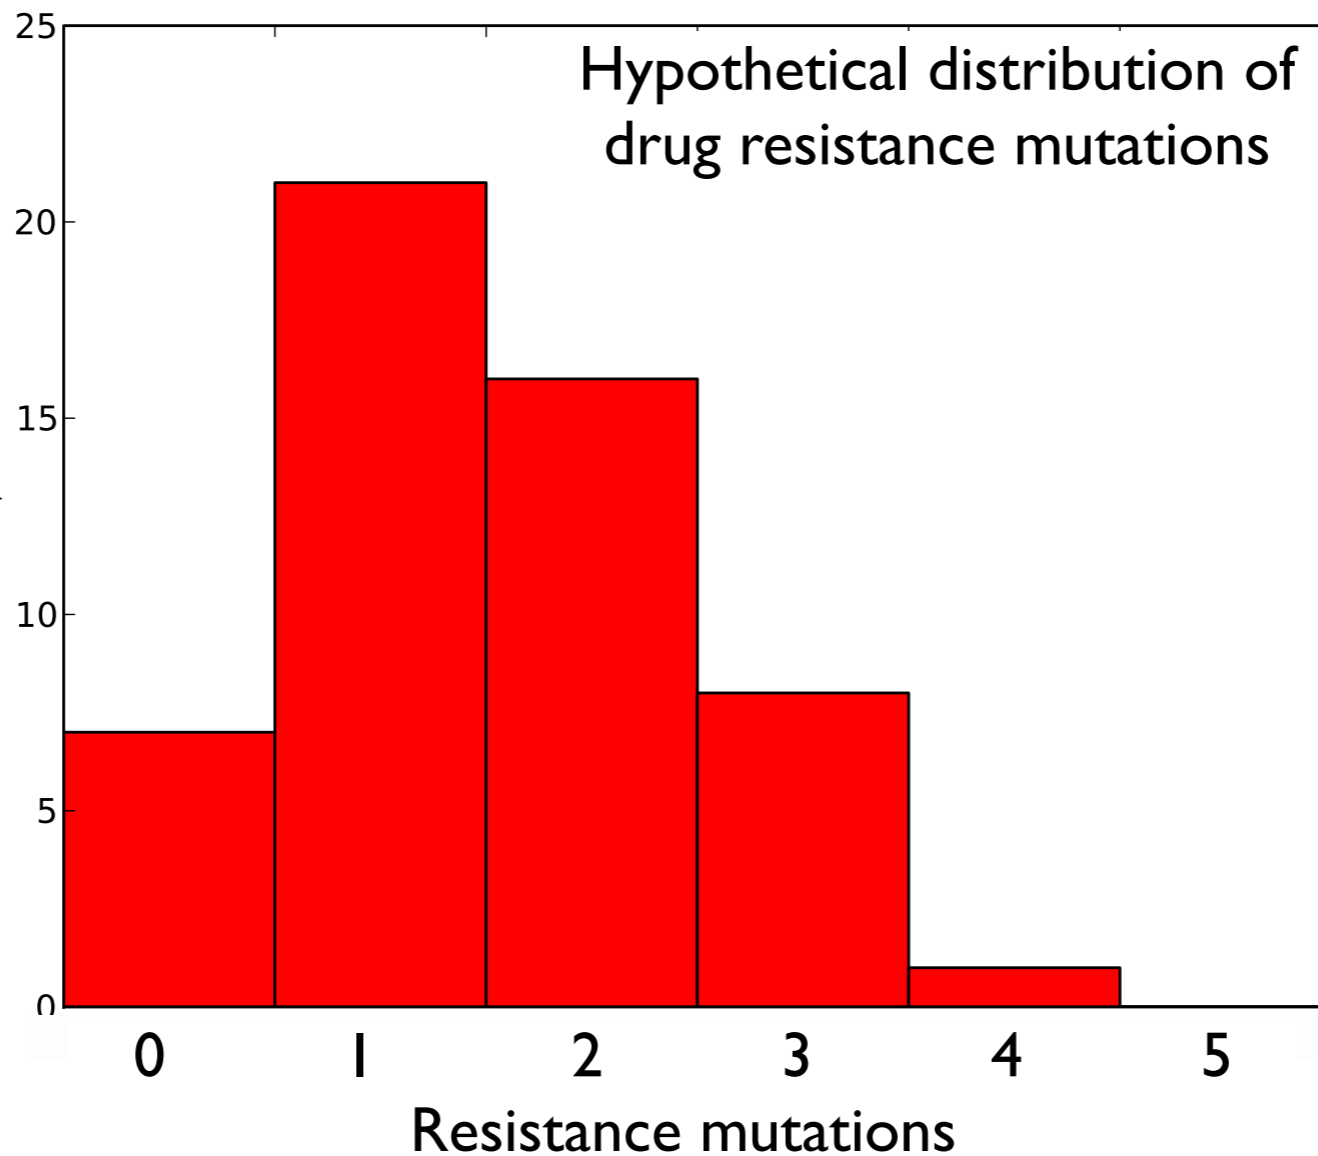

MAX-PLANCK-GESELLSCHAFT

Example: drug resistance of HIV

Drug sensitive: PQITLWQRPLVTIKIGGQLKEALLDTGADDTVLEEMNLPGRWKPKMIGGIGGFIKVRQYDQILIEICGHKAIGTVLVGPTPVNIIGRNLLTQIGCTL

Drug resistant: PQITLWQRPLVTIKVGGQLTEALLDTGADDTILEDMTLPGRWKPKIVGGIGGFIKVRQYDQVPIEICGHKVISTVLIGPTPCNIIGRNLMTQIGLTL

Quantifying the benefits of recombination [for the virus]

Example: drug resistance of HIV

Drug sensitive: PQITLWQRPLVTIKIGGQLKEALLDTGADDTVLEEMNLPGRWKPKMIGGIGGFIKVRQYDQILIEICGHKAIGTVLVGPTPVNIIGRNLLTQIGCTL

Drug resistant: PQITLWQRPLVTIKVGGQLTEALLDTGADDTILEDMTLPGRWKPKIVGGIGGFIKVRQYDQVPIEICGHKVISTVLIIGPTPCNIIGRNLMTQIGLTL

- Drug resistance increases due to selection on existing mutations

Quantifying the benefits of recombination [for the virus]

MAX-PLANCK-GESELLSCHAFT

Example: drug resistance of HIV

Drug sensitive: PQITLWQRPLVTIKIGGQLKEALLDTGADDTVLEEMNLPGRWKPKMIGGIGGFIKVRQYDQILIEICGHKAIGTVLVGPTPVNIIGRNLLTQIGCTL

Drug resistant: PQITLWQRPLVTIKVGGQLTEALLDTGADDTILEDMTLPGRWKPKIVGGIGGFIKVRQYDQVPIEICGHKVISTVLIIGPTPCNIIGRNLMTQIGLTL

- Drug resistance increases due to selection on existing mutations
- Novel mutations keep the wave going

Quantifying the benefits of recombination [for the virus]

MAX-PLANCK-GESELLSCHAFT

Example: drug resistance of HIV

Drug sensitive: PQITLWQRPLVTIKIGGQLKEALLDTGADDTVLEEMNLPGRWKPKMIGGIGGFIKVRQYDQILIEICGHKAIGTVLVGPTPVNIIGRNLLTQIGCTL

Drug resistant: PQITLWQRPLVTIKVGGQLTEALLDTGADDTILEDMTLPGRWKPKIVGGIGGFIKVRQYDQVPIEICGHKVISTVLIGPTPCNIIGRNLMTQIGLTL

- Drug resistance increases due to selection on existing mutations
- Novel mutations keep the wave going
- Via recombination mutations can keep up with the wave and “make it”

Surfing of beneficial mutations

MAX-PLANCK-GESELLSCHAFT

Surfing of beneficial mutations

MAX-PLANCK-GESELLSCHAFT

Evolutionary benefits of recombination

Conventional wisdom: **rate of evolution $\sim N$**

➔ holds only for very frequent recombination

Realistic recombination: **rate of evolution $\sim r^2 \log N$**

Recombination can limit the rate of evolution,
rather than the number of good mutations.

The more recombination, the better?

Is there a cost to recombination?

Mutations don't always add up
